CANTON, N. Y., Aug. 15 —Cheese — Offered 2,240 Twin cheese and 1,395 tubs of butter. Cheese sold at 10c; butter at 19¼c.

WATERTOWN, N. Y., Aug. 15—Cheese—Sales 6,500; 9¾@9⅞c for large ; 10@10⅛c for small.

UTICA, N. Y., Aug. 17—Cheese—The cheese market stiffened on New York advices today, large colored selling at 10c; large white, 9¾c, and small colored and white at 10½c.

NEW YORK, Aug 17—Butter—Receipts, 10,079 pkgs.; market steady; state dairy, 14@ 17½; extra creamery, 19c; common to choice, 15@19½c.
Cheese—Receipts, 1,491 pkgs; market steady; state full creamery, fancy, small colored, 10¼c; small white 11¼c; large colored 10c; large white, 9¾c.
Eggs—Receipts, 10,152 pkgs.; market firm; state and Pennsylvania, fancy mixed, 21c; state and Pennsylvania, seconds to firsts, 16@19c; western extras, 19@20c; western, seconds to firsts, 16 @18½c.

NEW YORK MARKET.

NEW YORK, Aug. 15—Butter—Receipts for the week, 55,325 packages.
Exports for the week, 1,675 packages.
Price for finest creamery butter was put up a half cent on Monday and dropped back to the old price, say 19 cents on Friday. Why this change, would be hard to explain.
Market started in with good demand from all quarters and extra fresh creamery was quickly taken at 19¼c, and buyers were looking for more; at the close of the week 19c was the quoted price. while sales of fancy goods were at 19½c, Under grades fresh creamery were in demand at 16 to 18c. New York State Dairy, when fancy and fresh, is salable at 18c, but most of the stock arriving is ordinary and packed in all styles of packages and has sold to packers and bakers at 14 to 16c. There was a trifle more business done in ladles; sales of best current makes reported at 14¾ to 15c, and active at 13 to 13½c. Nothing doing in renovated butter. We quote:

Creamery, extra, 19c: medium, 18@18¾c; poor, 15@17c; Dairy, extra, 18c; medium, 15 @17c; poor, 13@14c.
Cheese—Receipts for the week, 36,167 boxes. Exports, 4,530 boxes
Market is the same as last week, more buyers than sellers and best full cream cheese wanted at our outside quotation. Skims are having better enquiry and prices are firmer. We quote:
Full Cream, small, extra, 10¾c; medium, 9 @10; poor, 7@8c. Full cream, large, extra, 10¼@10¾c; medium, 9@10c; poor, 7@8c.
Eggs—Receipts for the week, 55,451 cases.
Fancy stock is scarce and wanted, and under grades are selling better and stocks are well cleared at the close. We quote:
New York & Penn., finest marks, per dozen. 21@22c; Northern & Western, finest marks, 20c: all Sections, poor to fine, 13@18c.
177 Chambers St. DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Md., August 13—Butter—At the time of our last issue, the market though steady in the finer grades, was by no means active, and ruled to a certain extent in the buyer's favor, but towards the close of last week (say Friday and Saturday), although prices were not advanced, there was a much better feeling prevailing, and all attractive stock was in good request. So far this week, with quite a perceptible falling off in the receipts of extras and firsts, there has been considerable trading, and prices on these grades have been advanced from a half to one cent per pound; seconds for the time being seem to be a back number, but as a rule holders are showing no disposition whatever to force sales. Imitations of the kind continue in moderate supply and demand. Ladles—All fresh sweet stock finds ready sale, while defective stock is very dull. Packing stock continues in rather light receipt; there is prompt sale awaiting fresh sweet arrivals. Blocks and Prints—The supply of desirable quality, though moderate, is about equal the requirements The general market at the close presents a firm appearance, and many predict still higher prices on all stock of desirable quality in the near future.
Creamery Separator, extras, 20@20½c; firsts, 18½@ 19½c; seconds, 16@18c. Imitation Creamery, extras, 18c; firsts, 17@17½c; seconds, 15@16c. Creamery blocks (2-lb.) extras, 22c; firsts, 20@21c; seconds, 17@18c. Creamery prints (¼ lb) extras, 23c; firsts, 21@22c; seconds, 17@19c. Md. Va., & Penn. Prints, extras, 20@21c; firsts, 19c; seconds, 16@18c.
Eggs—The receipts of eggs so far this week are very light, and only a very small proportion of the arrivals show strictly choice quality; for this class of stock there is a quick demand at top quotations, while heated and other undesirable stock is moving slowly, and in many instances the loss off is quite heavy; the market rules firm on all attractive offerings at 18½ cents.
Cheese—The receipts are ample; demand moderate; market quiet but steady.
N. Y. State—Cheddars, fine, 10¾@11c; choice, 10½@10½c; fair, 9@9½c, Flats, fine, 10¾@ 11c; choice, 10¼@10½c; fair, 9@9½c; Small, fine, 11@11¼c; choice, 10½@10¾c: fair, 9½@10c; Ohio Flats, fine, 9¾@10c; choice, 9@9¼c; fair, 8¼@8½c; O. Picnic, fine, 10@10¼c; choice, 9½@9¾c; fair, 8½@9c; Swiss Cheese, (domestic) new, fine, 13@13½c; choice, 11@12c; fair, 9@10c.

Note and Comment.

Ventilation—Siloing Millet—The Farmer's Schools—Rain, Heat and Flies—Milk Producers' Organization—Milk Prices—Value of Fodder Corn for Feeding.

ED. HOARD'S DAIRYMAN:—Note is made of what the editor recently said about ventilation in cow stables, and we comment thereon to say, that when the ventilators were put into our stables, a far more uniform and somewhat higher temperature was noticed, and maintained through the winter. It was surprising to note that the temperature in the stable was not influenced to any great extent by outside conditions incident to sudden, and severe falls of temperature. Six degrees was the greatest change registered by the thermometer in the stable, and there was a corresponding uniformity in the yields of milk. The varying yield of milk, in the ordinary stable, is a pretty good barometer of outside conditions, but in the warm, well ventilated stable, with air draft shaft, they part company. The moral is: put in a wooden box air shaft, with a length of not less than 30 ft., extending in any event above the ridge of the barn, with a damper in it, and see the change it will make in a stable.

I am written to about a plan of siloing millet, and what is your opinion about it? We once filled a pit with millet, and the output of the pit was in keeping with the condition of the millet as it went in. That which was wilted, to any extent, spoiled and moulded, about in proportion to its dryness. The millet which was forked into the pits, fresh from the mower, made pretty good silage, some extra fine. That which was fairly ripe, did not keep nearly so well, as that which was just coming into the milk stage of the seeds. I am of the belief that if this millet had been run through an ensilage cutter, and sliced into ½ inch lengths, and wet down as it went into the silo, it would have made good silage, but I am joining this belief with the clover silage experience, that both had better be hayed, making them when pretty green into large cocks of 5 and 6 hundred weight each, and let them cure out for ten days before putting into stack, or mow. Up-to-date corn is the only real, reliable article to bank on for silage.

In a recent issue of the DAIRYMAN, Gov. Hoard remarks, that "the farmer sends his children to the poorest school in the land and has little disposition to make it better than it is." Granted in some sections, and too many of them, but if the Editor will come to the Western Reserve of Ohio we will gladly, in 30 exclusively rural townships, show him as many centralized schools where the farmer boys and girls are getting the best education that can be given to boys and girls, up to the very doors of the college, where these graduates can enter the freshman class and escape the preparatory year by presentation of their centralized school diplomas. True, there is as yet no agricultural course in these centralized schools, but on the farms where the owners have the spirit to abolish the district schools, and in the one school have a modern up-to-date course of study and a pride in that school, one will find a spirit of improvement in agriculture, that counts for a good deal in making for "science" on the farm. Prof. Robertson of Ontario has been over here, and filled his head with measures of useful fact and information from these "Yankee schools" and has returned to adopt the principle in the establishing of thousands of the "consolidated" schools in Canada, and going us one better by making an agricultural course part of the plan of advance study, and we will have great satisfaction in copying from his added plans.

We have demonstrated that the farmer boys and girls *can* have as good an education at home, as the city or village boy, with his *street* experience and knowledge of the world left out; so when Prof. Robertson has gotten his ag'l graft "worked in" and successfully, we will copy his amendment and then see the educated farmer boys and girls stay on the farm. I am hoping that this new plan, of centralizing the rural schools, and getting the best of teachers, giving the best general education possible at the home, will soon become universal, and then what you say "The farmers want the schools poor and cheap" will no longer obtain, and the thing will be reversed "that the farmer will soon pay more to educate his own children, than he does now to educate professionals" and the country school will become the foundation from whence shall spring our immediate, and future, National greatness.

We are having no end of rain and dog day weather that refuses to coincide with Bro. Hicks' almanac, and the haying languishes, and the oat cutting is upon us, and a swarm of horn flies beclouds the sun, so to speak. Pastures are very good, but the silage corn is pretty spotted as to height, but as to weeds, in many fields there seems to be much uniformity. It is pretty hard to tell what prices are for milk. Some factories paid 70 cents for the last ten days of July; some more; and the milk retailers of the city are charging 7 cents a quart for their two cents a quart milk. As between city and country, there seems a growing disposition to organize the producers and "hang together," a little more strenuously. The northeastern corner of the state, where milk goes by the train load to Pittsburg, is well organized, and the producers and dealers are to have a great union meeting in Pittsburg Sept. 1st and agree on something definite, and see if there is not more money in conciliation and mutual co-operation, than in the methods of the past, and "yours truly" is going down to hold the crock of cream, while the sparring goes on.

The trolley roads that enter Cleveland from all directions, and in the past have carried milk into the city at a much less price than the steam roads, have now boosted their price to two cents a gallon, a half cent more than the steamers, and with much loss to themselves, and much gain to the creameries. Of course, this started the cry of famine, and up went the retail price of milk to 8 cents per quart, but not the country prices. There is to be a lot of adjustment to go on this coming fall between farmer and city dealer, and it would not be surprising to see the gap between 2 cents a quart and 7 and 8 cent milk, shortened up from the bottom way. With feeds high, silage corn an uncertain quantity, help scarce and high and a little disposed to be saucy, and Tom L. worrying your uncle Mark a little, the farmers are more disposed than ever to have fair play, and what may happen is a little uncertain as to future milk prices. Some are awaiting with a little impatience to see, or hear, something in regard to our new dairy commissioner who now has been in office some six months, but the enemies of the dairy are so quiet and little disposed to "pester the saints" that in the words of the poet, "Nothing seems doing." It seems almost too good to be true that we have arrived so near the millennium that the dairy needs no official help, no crooked ways to be made straight, no light thrown across one's pathway necessary, and that the duties of the office of commissioner consist only in issuing an official report at the end of the year.

I am always interested in what is going on in Northern Minnesota, and notably the efforts there to make use of the greatest of all plants the "corn-straws." While up there a few weeks ago it seemed as if the farmers were to be defeated, as the crop, owing to lack of rain, looked so very backward, but by a recent western farm paper I note that corn in the north, in feeding value, is not to be measured by its development, but by its age; "that a field of corn 60 days from planting,

All our Cook Stoves and Ranges have patent oven thermometers.

without an ear in sight, contained as much nutriment as did corn in southern latitudes at 90 days and fully eared at that." This seems too good to be true. and will I fear have to be taken for the truth by cattle in the far northwest this coming winter; but will it be as filling? This is a variation of the older assertion, that corn drilled so thick that it fails to ear, will actually carry more food nutrients and more protein, than a field of well nubbined silage corn.

Last year, owing to our cold, wet summer, silage corn failed to ear to any great extent, and the common report was that it was much below the feeding qualities in former years, when there was heavy earing. Its awfully consoling to hear that a small stalk with little ear, has more available nutriment than a big stalk with much leaves and large ear. Is it a fact that nutriment of leaf and stalk is more available and easier of digestion than that of the ears? All these are important matters and of great value if demonstrated, and if what is true of the more northern latitudes is as true of the natural corn belt, if it is, then the thing for we 42°-parallelers to do, is to plant small corn, put it into the silos about the 20th of August, and the rest of the season ride about in our automobiles, visit the resorts,and evenings cut coupons off from our bonds. JOHN GOULD.

Silos and Ensilage.

Water for Dry Silo Corn.

ED. HOARD'S DAIRYMAN:—Some five or six years ago I built a building after a plan I saw in the DAIRYMAN, and divided it in the center, making two silos of about 100 tons capacity each. The plan called for the frame going horizontally around, and spiked together with corners inside cut off, which I did not do, and I wish to say that the silo has never sprung out of shape. It was boarded double inside with tar or wax paper between and clapboarded on outside onto up and down slats, of 3 or 4 inches in width.

Now for the experience; one of my neighbors who had a silo told me my corn was so ripe (it was all glazed and fit to cut for the old way of harvesting and husking) that if I did not put on some water it would heat and dry out, or,as we call it,"fire fang" and be worthless. He did not say how much to put on, and I calculated that the heat would be great, and it would need quite an amount. Therefore I put forty barrels on each silo of 100 tons. I had very fine ensilage, and feeding two bushel baskets to each cow per day, with all the grain that grew on the stalks, they improved in flesh and gave a good supply of milk. The milk was fine and there was no taste of ensilage, either in milk or butter made.

A friend of mine, who put his in the silo in the milk stage of the corn had to stop feeding his ensilage, because of the milk tasting so that his customers would not take it. We have continued to let the corn ripen, and wet it when put into silo, with the exception of one year my son thought he would not wet it, and the consequence was that we lost several tons of ensilage, and it was largely in the square corners, which I could hardly account for, but while inside mending the bottom of the silo last year (by the way 7½ feet of the silo is in the ground, or as low as bottom of cellar where cows are tied up) I had some water left and as I stood there I threw it up against the hemlock siding inside, and was surprised to see how quickly it dried off, and then it came to me that the dry siding drawing so much moisture from the ensilage and double the amount in the square corners was the source of the loss of so much ensilage in the square corners being lost as is complained of every year. I concluded to try an experiment on last year's ensilage, when put in, and put on 60 barrels of water to each silo, and put fully one-half of it into the corners and against the siding. The result was all I could ask, not a bushel of spoiled ensilage. Rather than put on less water, I would put a barrel to a ton of ensilage.

I expect to be called a crank and was told I was a fit subject for the insane hospital when I first put forty barrels on to each silo. I hope some one will try it and convince themselves as well as others. If any further evidence is needed it can and will be furnished upon request.

I would suggest to all that have silos to thoroughly saturate them with water or wet the ensilage and let the tramping of the silage go as it will be heavy enough to take care of itself. N. S. W.

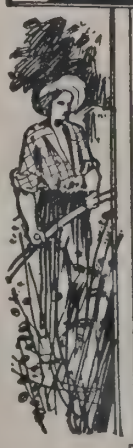
For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains

360 acre farm, 4½ miles from Crookston, Minn , (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a 320 acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,



160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

Mr. Wheaton's Canadian Dairy Notes.

Syndicate Work in Western Ontario.—The Season's Quality of Cheese.—Causes of off Flavor in Cheese.—Advice as to Remedies.

ED. HOARD'S DAIRYMAN:—Mr. Geo. H. Barr, Chief Instructor for the Dairymen's Association of Western Ontario has been appointed Superintendent of the Western Dairy School, Strathroy, Ont., to succeed Arch. Smith, resigned. Mr. Barr is one of the best cheesemakers in Ontario, and has also a reputation as a first-class buttermaker. No better selection for this important position could have been made, and we may look forward to a successful season at Strathroy, this winter. The school will open on December 1st next.

Dairy syndicate work in Western Ontario is progressing favorably. A noticeable improvement has been effected in the appearance of the factory, the makers vying with each other as to who shall have the finest appearing factory. Rivalry in this particular will lead to improvement elsewhere. And it has done so. The cheese made at the syndicate factories has undergone a marked improvement in appearance. Even if nothing more were done the first year, this would pay for the cost of this new movement. No matter how fine the cheese may be in point of quality, they will not command the highest price unless they are uniform in size, and neat, clean and tidy in appearance. Many makers neglect this end of the making business, and are content if the cheese bore well and the flavor is clean. They are surprised afterward if their product does not sell as high or please the buyer as well as the cheese of a neighboring factory. All these little things count in the making of the finest cheese.

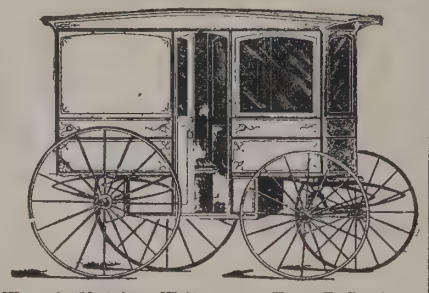
Improvement in the appearance of the factory and of the cheese should not stop here. It should lead to improvement in the quality of the product. And so it does. But this is not detected as quickly as improvement on the outside. However, this syndicate work is reaching deeper than the surface and by the end of the season some very favorable reports will be forthcoming as to the general improvement in the quality of the product made in the factories receiving instruction from Supt. Barr and his corps of instructors.

Strange as it may seem, the season so far has not been the best for making the finest quality of cheese. In July many makers had bad flavors to contend with, which made this special instruction all the more necessary. While grass has been plentiful, the weather comparatively cool, and conditions, one would think, generally favorable, makers have not found it smooth sailing especially during the past month.

Often, the bad flavors which develop under seemingly favorable conditions are the most difficult to cope with. They are out of the ordinary and thus baffle the maker because of their newness and the necessity for new methods of procedure in dealing with them. Here is where the competent and observing instructor can do good work and test his ability to give assistance in a time of trouble.

There are four syndicates, with an instructor over each, in Western Ontario, and one cheese instructor and two butter instructors in addition, who visit factories on application. This part of the province is therefore better served this year than it has ever been in the way of instruction and a marked improvement in the general quality of the product may be looked for.

Reports from eastern Ontario syndicates are also satifactory. In the east, as we have noted in previous letters, there are over twenty syndicates, under the superintendancy of Chief Instructor G. G. Publow. All the factories are in touch with his work and improvement all along the line is expected. The work, however, cannot be accurately guaged until the close of the season. Like in the west the patrons are quite in sympathy with the movement and are helping it along wonderfully well.



They have bad flavors to contend with in eastern Ontario also, Mr. Publow has found considerable difficulty in handling a bad flavor, which so affects the curd as to prevent its breaking down and leaving small oblong holes. In the milk this is detected as a hot, bitter flavor that is hard to get rid of.

Samples of curd affected by this flavor were sent to Dr. Connell, Bacteriologist, Queen's University, Kingston, for examination. He reports the flavor to be derived from a yeast growth, but is at a loss to decide the source from which it comes. He thinks, however, that like the trouble located by Prof. Harrison of Guelph last year, it may come from trees in the vicinity of the milking yard or near where the milk is kept. As it would be difficult under these conditions to get at the source of this infection, every care should be taken to prevent its propagation in the milking utensils and around the factories. This can be done by thoroughly cleansing and scalding all milk cans and milk pails

Rippley's Fly Remover

instantly removes all flies, mosquitos, lice and other insects from cattle, horses and other animals sprayed with it. It is healing to any sore. Animals rest easy and feed quietly all day. Cows give ¼ more milk, which is a big saving. 1 gal. will protect 500 cows. Endorsed by the best class of people. Order at once and secure agency, you can sell hundreds of gallons. 1 gal., $1.10; 2 gal., $2.10; 5 gal., $4.50; 10 gal., $9.00. RIPPLEY'S Special Sprayer for applying same, 65c; 4 gal. Compressed Air Sprayer for applying same on large herds, $5.00; 5 gal., 5.50. Money refunded if not as represented. Our Breeders' Supply catalog mailed free; tells how $8.00 per head can be saved by using Fly Remover; ½ bbl. lots of 30 gal., $25; freight paid on 20 or 30 gal. lots.

Gentlemen:—For three years I have been experimenting with different things to keep flies off my cows, but not until I tried your Fly Remover and Compressed Air Sprayer was I successful. I used this last year and found that it costs less than one cent per week per cow. With your Compressed Air Sprayer it takes but a few minutes to put it on, and the result has been that my cows were free from flies, and during the year gave 6400 pounds of milk each, which made 324 pounds of butter per cow. I can heartily recommend it to all stock owners.—JOHN ARMSTRONG, President State Board of Agriculture, De Smet, S. D., June 4, 1901.

after use and looking well after the sanitary surroundings of the factory.

In some sections of the East this bitter flavor is very widespread and is seriously affecting the quality of the product. It is not so noticeable in new cheese, but when the cheese becomes older this bitter flavor becomes most marked, injuring the sale of the product. Patrons of factories n the infected districts should pay strict attention to the milk. All cans carrying whey home should be well looked after.

Prof. Harrison, in the case of the bitter flavor prevalent in Western Ontario last summer, gave it as his opinion that the infection was carried through the whey tanks; 81 out of 82 samples of milk taken from cans that had been used for carrying whey, showed the infection. In the exception, the farmer had not used his cans for hauling the whey.

A trouble of this kind in any factory is like a contagious disease in the neighborhood and it is every patron's business to see that the disease is stamped out and the infection is not carried from one to another. One patron's neglect may affect the whole neighborhood and ruin the reputation of the factory. Hence the importance of strict adherence to duty in everything pertaining to the care and handling of milk.

A flavor of this kind is something the maker is in no way to blame for. If he exhausts all his ingenuity in a fruitless endeavor to counteract its injurious effect upon the quality of the cheese he should not be held responsible for any loss that may result, as some patrons think he should be.

Instructor Publow advises the makers in the infected factories, if an attempt is made to have them make good the loss from this bad flavored cheese, to go out on strike. Such a procedure would mean a serious loss to some body, but it would be no more than patrons deserve who would try to hold makers responsible for something that they themselves are wholly to blame for.

Dr. Connell advises cooling milk to at least 65° or better to 60°. This is quite in line with what we have been advocating for the past few years. A few years ago it was not thought advisable to cool milk to a low temperature for cheese making. But experience has shown, that milk at a low temperature will withstand the growth of many of these lower forms of life, which cause bad flavors in milk. It will pay every patron to cool his milk to the temperature advised by Dr. Connell. The milk should be aerated where the atmosphere is pure, before being cooled. Don't stir it near the barnyard fence or in close proximity to the hog pen. Do it in a place where the air is pure and do it quickly. Then set it in cold or ice water to cool to the required temperature. If all milk were cooled in this way, the maker would have more control over the product. He could use a "starter" with the right flavor and carry on the process of making in a more satisfactory way.

Some valuable reports have been received by the supt. of the consolidated cool curing station at Woodstock, from cheese recently shipped. Hodgson Bros. cheese exporters, Liverpool, state that the cool cured cheese arrived in Liverpool in much better condition than the ordinary cured cheese. It was also of superior quality and better in every respect. The ordinary cheese was sold at a figure one-sixth less than the cool cured article. Had the market not been very brisk the ordinary cheese would not have sold as well.

The same firm report that there is a prejudice in England against paraffining cheese. which it will take sometime to overcome. They state that it undoubtedly prevents shrinkage and preserves the quality of the cheese.

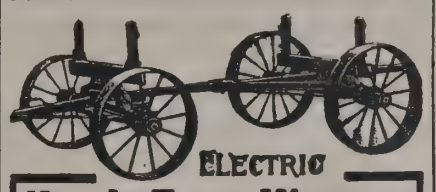
Some favorable reports are forthcoming this season from England as to the quality of Canadian butter. It is said to be giving good satisfaction. The quantity made so far is away below that of last year and our exports will be much lighter. J. W. WHEATON.

Toronto, Can.

An Unfruitful Bull.—Grass for Nebraska Pastures.

ED. HOARD'S DAIRYMAN:—Which grass will produce the best pasture for dairy cows on extreme sandy soil.

We have a Jersey registered bull, six years old, who is very slow in service and not at all sure. M. O. W.



Norfolk, Neb.

The best advice we can give is to get a younger bull as yours is old enough to retire from service, but if you do not care to do this, you may give the bull more physical work, so that his constitution will grow stronger.

(The office editors are not sufficiently acquainted with Nebraska conditions to answer the question as to the best kind of grass for pasture on extreme sandy soils there, and therefore advise that the question be submitted to the Agricultural Experiment Station of that state.)

34 cows and heifers in the **McGEOCH HERD** have been **officially tested** with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs. of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs. of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by **Gem Pietertje Hengerveld Paul De Kol,** or **Sir Ormsby De Kol** for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days; average per cent of fat 4.47. Are these the kind of **Holstein-Friesians** you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd?

For particulars address **H. B. Daggett, Mgr., Station A, Milwaukee, Wis.** Residence: National Ave., near 40th. Phone, South 1601.

Observations Among Swedish Creameries.

Paper read at the Wisconsin Buttermakers' Convention, Waukesha, by R. Elliot.

I am somewhat afraid that a paper on this subject will not be of a great interest to Wisconsin Creamerymen, as advanced and modern creamery methods in countries in which the butter making industry has become one of importance, must necessarily be more or less similar. Before I proceed to point out some differences between American and Swedish methods, I should like to give you a few data regarding the history of the creamery industry in Sweden.

In the beginning of last century milking cows was considered a necessary evil rather than a source of profit. One of the first books dealing exclusively with the manufacture of butter was published in the year 1802, by a Dr. J. Anderson. He advocated a shallow pan system and a temperature of 50 to 56° F. for the creaming of milk. The cream was not to be removed before the milk was sour and partly coagulated. It is curious to note, that even a hundred years ago a good many things were known regarding the properties of milk. He points out the thinness of the foremilk and the richness of the strippings and also that the milk loses a great deal of its creaming quality if it is not set immediately after it is drawn from the cow. He also mentions that when milk is mixed with water, before it is set, it will cream more readily, but the quality of the cream will be impaired. He was of the opinion that butter could not be obtained unless the cream were sour. He says: "If it is attempted to churn cream before it is sour, churning must be continued until the proper degree of ripeness or sourness is obtained or the butter will not come. The dairyman should therefore keep the cream until it is quite thick and sour and it may be kept for several weeks without injuring the quality of the butter."

He recommends washing the butter, but in other respects his method is extremely crude.

About the year 1840 the Holstein method was introduced. It was practically the shallow setting method, but attempts were made to keep the milk sweet while creaming and it was set in underground cellars, well ventilated and built for that purpose.

About 1846 it was found that good butter could be made from sweet cream.

The shallow pan system with various modifications was used up to between 1860 and 1870 when a method, claimed to be invented by a Mr. Swartz, about the year 1864, gradually began to displace the previous methods, namely the ice system. About this time the first large creameries appeared, and from 1870 up to the time when the continuous separator was invented, the deep setting, or, as it was called, the ice system, was used almost exclusively. In 1887 Dr. De Laval, of Stockholm, solved the problem of a continual separation of cream and from that time the creamery industry has grown by leaps and bounds, greatly aided by liberal government appropriations for instruction, as well as by a great activity on the part of the different experiment stations in Denmark and Sweden.

Creameries in a modern sense, did not exist in the country until about 1870. Between 1850 and 1860 attempts had been made to establish so-called village or district creameries. They were a kind of proprietary creameries, but as the ice and deep setting systems were not known then, the product was of a very inferior quality, and these creameries were often shut down for want of support, as the farmers could do about as well with the cream by handling it at home.

Therefore these creameries disappeared, and after the introduction of the cold setting system, creameries operated by companies or private owners came into existence. Co-operative creameries were started between 1885 and 1890 and have increased in number every year since then, while the number of proprietary creameries is decreasing year by year.

With regard to the character of the creamery buildings in Sweden, I may say that they are without exception built of stone or brick. They would never think of erecting a frame building with wooden floors for a creamery over there. The buildings are stone and brick throughout, the outside walls often being very thick. The partitions between the different rooms are also of brick and stone. Cement floors are seldom seen; flat, smooth, square, or rectangular, stone slabs with cemented joints being generally used.

The engine and boiler room is of course separated from the making rooms. There is generally a tendency to divide the building into several separate rooms for the different processes and stages of manufacture. Thus, you will generally find a separator and intake room, also separate rooms for churning, ripening cream, working butter, etc.

The Alpha-Laval separator is almost exclusively used throughout the country.

The separating temperature used to range between 84 and 100, F. and the De Laval people used to recommend this temperature as giving the best results with their machine. Later we have learned, however, that a more effective separation may be obtained at a somewhat higher temperature. The skim milk from the separator flows into a tank, from where it is pumped into the cheese vats in another part of the building to be made up into skim milk cheese, or, if intended to be used as food, it is pumped into a pasteurizing machine, pasteurized and quickly cooled down. The pasteurizing apparatus for both cream and skim milk are of the continuous type. The cream is supposed to be retained in the pasteurizer for 20 minutes. The capacity of the pasteurizer is, of course, adjusted to the quantity of the cream handled at the creamery, so that the cream is pasteurized, cooled down and ready to be warmed up to ripening temperature shortly after separating is over.

Practically, all high grade butter intended for the British markets is made from pasteurized cream. I do not think that you will find a single creameryman there who does not believe in pasteurizing. Although not enforced by law in Sweden, as it is in Denmark, it is nevertheless general as they have found out that it pays. The pasteurizing temperature is generally in the neighborhood of 185° F., which would seem to us here to be unnecessarily high. To enable them to use such a high temperature, they cool the cream rapidly to a very low temperature, preferably below 40° F. I have sometimes found butter over there to have a cooked flavor, caused by a high pasteurizing temperature, especially when the cream was not cooled down rapidly to a low temperature. A slightly cooked flavor, however, is not considered to be

It Must Come.

As inevitable as the changing seasons of the year is the change which comes to every woman. And just as one anticipates the changes of other seasons it is wise to anticipate this change of season and prepare for it. In this way the discomforts and disasters suffered by many women at the period of change can be avoided or overcome.

Dr. Pierce's Favorite Prescription, a medicine for every season of woman's life, will entirely meet the needs of women at this period of change. It cures the physical ills and relieves the mental anxiety and depression usually associated with this critical period. It tranquilizes the nerves, encourages the appetite and induces refreshing sleep.

$500 REWARD! FOR WOMEN

WHO CANNOT BE CURED.

Backed up by over a third of a century of remarkable and uniform cures, a record such as no other remedy for the diseases and weaknesses peculiar to women ever attained, the proprietors of Dr. Pierce's Favorite Preseription now feel fully warranted in offering to pay $500 in legal money of the United States, for any case of Leucorrhea, Female Weakness, Prolapsus, or Falling of Womb which they cannot cure. All they ask is a fair and reasonable trial of their means of cure.

J. S. Carlisle, Esq., of Manchester, Coffee Co., Tenn., writes: "I have been using your medicines for the last sixteen or eighteen years in my Poor-house. I am superintendent of the Coffee County Poor-house and Asylum combined, Your 'Favorite Prescription,' 'Golden Medical Discovery' and 'Pleasant Pellets' are the best medicines for the diseases for which they are recommended, that I ever used. They saved my wife's life at the time of 'change of life.' I have been recommending your medicine to many afflicted women and have also guaranteed that if it did not cure I would pay back the money spent for it. I have told our druggist that if the people came back and said Doctor Pierce's medicines did not give satisfaction, to *give them back their money and charge it to me.* I have not once been called upon to refund. I have never found anything to equal the 'Favorite Prescription' for diseases of women."

Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of 21 one-cent stamps for the paper covered book, or 31 stamps for the cloth bound. Address Dr. R. V. Pierce, Buffalo, N. Y.

59 Murray St., New York City.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

CHAIN-HANGING

CATTLE STANCHION

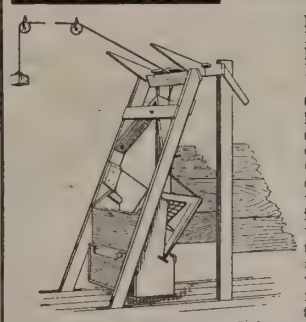
The Most Practical CATTLE FASTENER ever invented. Manufactured and For sale by

O. H. ROBERTSON, Forestville, Conn.

a very serious fault and will often disappear after a few days. It is claimed that a high pasteurizing temperature and a rapid and thorough cooling will more effectively remove objectionable flavors from the cream, especially feed taints.

When the cream is all pasteurized and in the cream vat it has generally a temperature of 45° F. and must therefore be warmed up somewhat before culture is added. The Swedish method of ripening cream differs considerably from the American method. They believe in a low ripening temperature, a small per cent of starter and give the cream 18 to 20 hours to ripen. I do not know that this method is to be preferred to the one practiced here, viz., a high temperature, 10% to 20% of starter and 4 to 5 hours for ripening. There has been considerable controversy regarding the two methods in Sweden and personally I think that the American method is a handier one. It is claimed, however, that by ripening at a low temperature a better body in the butter is obtained, but probably there is not much in it as just about as good butter is made here by the American method.

The churn used in Swedish creameries is the Holstein churn, which would, no doubt, seem antiquated to an American. It is stationary, barrel shaped, somewhat wider at the top than at the bottom and has an upright, revolving dasher. When churned, the butter is taken out with sieves and washed in a barrel or vat containing pure cold water. It is then put into a trough and allowed to drain. The combined churn is beginning to come in now, however, and will no doubt in time displace the Holstein churn in most of the large creameries.



A worker similar to the Mason is used and the butter is generally salted on the worker. When it is partly worked it is taken out and placed in ice boxes and left for about two hours. It is then finished on the worker and packed. Swedish and Danish butter is packed in casks made of beech holding about 112 lbs. each.

The butter is never stored or held at the creamery, but is shipped to the buyer at least once a week so that it reaches the British market when it is about 10 days old. An ordinary ice cooled room will, therefore, give all the refrigeration that is needed because the summers are not as hot as they are here, and owing to the substantial character of the buildings and the material employed, the rooms never get very warm. The windows are whitewashed in the summer and this helps to keep the rooms cool.

There is considerably more help employed in a creamery over there than here and consequently everybody has ample time to do his work well. Except

Watering the Herds

WITH the fencing of the ranges has come the need for an artificial water supply upon the great stock farms of the West. That cattle may thrive and fatten for the market, it is absolutely essential that this supply be both *constant* and *abundant*. The picture shows a typical scene upon many of the largest ranches, where the **HOT AIR PUMP** is delivering its supply into the storage tank, whence it is drawn off daily as required, in any volume up to 100,000 gallons. No driving of the herds to some distant river is required, thus much expense is saved and the cattle drink quietly, as nature dictates, at an *ever ready* and *abundant* supply. Descriptive Catalogue B5 sent free on application.

Rider-Ericsson Engine Co.

Remember, the Hot Air Pump is Automatic, requires no skilled attention, and is the cheapest form of constant water supply now known.

Teniente-Rey 71, Havana, Cuba.

It pays for itself on the first crop grown after its use.

It Spreads Manure,

wet, dry, lumpy, caked, strawy, full of corn stalks, etc., better than it can possibly be done by hand. Spreads lime, ashes, salt, compost, etc.

THE IMPROVED

Kemp Manure Spreader

will save more hard labor, more time, more money and bring about better results than any other machine that can be employed on the farm. It trebles the value of even a small amount of manure. It is the only thing that can successfully top dress wheat in the spring, meadow lands, pastures, etc. Can be hauled onto any land easily and without injury to land, as wheels have broad tires. Can be turned on the ground it stands on, as front wheels turn entirely under. It is strong and durably made of good material and with ordinary care will last indefinitely. Greatly improved for 1903. Send for new illustrated catalogue and "How to Grow Big Crops"—Free. Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.

to receive our catalogue. We can supply your wants at prices that are right.

Write us.

BAVIER NOVELTY CO., WINDSOR, CONN.

in the smallest creameries there is an engineer to attend to engine and boiler. He generally cleans and puts the separators together also, but does not run them. As a rule the manager does not do much hard work round a creamery. He sees that everybody is doing his share of the work properly, attends to the ripening of the cream, book keeping, etc.

The farmers generally take pretty good care of the milk, especially in dairy sections, and the milk is, in most cases, delivered every day, Sundays included. It is to be hoped that this custom will be abolished when the farmers have learned the simple art of caring for their milk. The milk cans hold about 12 gallons (50 litres) and in a good many creameries they are washed with soda solution every time, rinsed and steamed before they are returned. The milk is generally drawn to the creameries in loads.

In some co-operative creameries the skim milk is returned to the patrons, but in most cases it is made up into skim milk cheese, for which there is a great demand.

With regard to the basis of paying for the milk, I reget to have to say that the old pooling system in many places still prevails, at least it did four years ago. The DeLaval Lactocrite was found to be too complicated and difficult to manipulate. The butyrometer, which was invented over there somewhat later, is simpler and is used in a few places. A few creameries use the Gerber test. Where the pooling system is practiced in a co-operative creamery, the profits are divided according to the quantity of milk each shareholder sends to the creamery.

The creameries vary considerably in size. There is quite a number of small creameries, although most of these are very well equipped. There is, however, a strong tendency towards centralization and combination of smaller plants into large establishments. This has long been advocated by dairy authorities, and the number of large central creameries is increasing.

When God divided the waters from the dry land he appears to have forgotten Sweden. At least that is the explanation, given by some, of the fact that about one-tenth of the entire area of Sweden is water. All over the country are innumerable rivers and creeks and thousands of lakes, large and small, ranging in area from 2,400 square miles to half an acre. In such a well watered country it is evident that little difficulty is experienced in finding suitable locations for creameries with regard to water supply and drainage facilities.

There are a number of well equipped dairy schools in the country maintained by the government. They have a 12 months' course and a certain standard of education is required for entrance as well as one year's practical experience in creamery work.

Home dairying or butter making on the farm is not taught in any of the dairy schools, nor is it at all encouraged. It is generally recognized that the factory system is the only right one and wherever there is a creamery the farmers support it. Farm butter making in creamery sections is condemned, and justly so, as it is estimated that the country would lose between 5 and 10 cents for every pound of butter made on the farm.

The hand separator has not gained much ground in Sweden, and there is no likelihood of its doing so for a long time to come, as the present system is giving good satisfaction.

The country is divided into 25 dairy districts and the government maintains a competent instructor and inspector in each. It is his duty to go wherever his services are demanded within his district, at a very small cost to the party who needs him. The DeLaval separator company also maintains a dairy expert who is constantly on the road and ready to give his assistance to any buttermaker in trouble, and the importance of instruction by competent men in the different branches of dairying is well recognized as well as admirably cared for.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Disease Among Young Stock.

On one year and year and one-half old calves there are spots on any part of the body, varying in size from a ten cent piece to a silver dollar or larger, with no hair, rough or rusty, slightly raised (only slightly) dirty dandruff in color. Do not appear to be warts.

Some animals have white film come over the

21 STRONG REASONS
WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to own a low-priced farm than to owe for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agricultural districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.

NOW Is the time to Subscribe for HOARD'S DAIRYMAN.

eyes, and in some instances a raised speck on the pupils. A DAIRYMAN SUBSCRIRER.
Wisconsin.

ANSWER.

If the trouble is general, it appears to be a contagion which requires a personal examination. Employ a qualified veterinarian.

Altered Secretion.

We are having some trouble with our cows in this way: The udder will become very hard and feverish from one milking to the next. The milk is like muddy water. This will last from one to four days and sometimes longer. C. E. P.
Du Bois, Pa.

ANSWER.

Altered secretion is almost invariably due to errors in feeding or impure water. Ascertain the cause and remove it. You may also give each cow so affected a full dose of physic, Epsom salts preferred.

Brain Trouble.

Had a valuable calf seven months old die today. First I noticed he was turning round and round as if to bite his tail. He frothed at the mouth. In about five minutes he was down and ten more he was dead. I cut paunch and stomach open, but could find nothing abnormal. M. L. C.
Bloomingdale, Ohio.

ANSWER.

Your calf died from brain trouble, which may have been a parasite within the brain. This is why you did not find anything abnormal in the paunch and other organs. As a rule this disease is incurable.

To Prevent Milk Fever.

I have cows coming in next month and would like to know if there is any way to prevent milk fever; is there anything to do to them before they have calves? G. A. S.
Stitzer Wis.

ANSWER.

The best known preventive for milk fever, is not to feed heavy before the cows come in. If you wish to crowd the cows, do it after they have calved. It is also advisable to keep the bowels open before calving, but do not deplete the animals with physic.

Navicular Troubles.

Ihave a horse that was taken lame in right hind leg six about weeks ago, there is no swelling or enlargement or heat that we can find. He does not limp much when he walks, but is very lame when trotting or going up hill.
Rockland, N. Y J. W. J.

ANSWER.

If you are sure there is no enlargement in either of the joints, we should attribute the lameness to navicular trouble. Blister the coronet and fetlock joint with a 1 to 4 cantherides ointment once daily, for three days in succession; rest the fourth and wash off with soap and warm water the fifth day. When dry apply fresh hog's lard to the blistered surface, this may be repeated in two weeks if not successful.

Spasmodic Colic.

One heifer has been in milk now, for 6 weeks. At time of calving, for three days, she acted as though she was in great pain. The symptoms were the same as a horse with the colic and now she has spells at short intervals of the same kind. She eats all right between spells, but when the spells are on she refuses her feed. There is no discharge of any kind, she appears all right only when she has those spells.

The calf three weeks old and is not able to stand up yet. The calf is fully developed in every way and apparently in perfect health. Good appetite and always knows when it is time for the cow to come up. The calf sucks all right only a man has to hold him up. Bowels are in perfect order. Calf is getting fat and growing fast. He is willing to get up, in fact he tries hard.

What is the cause of the so called Jack sores? The sores come on the knees and in front of the hock joint. The joints swell very badly and have large, raw running sores. The one in question has a sore on the hock for over a year, it is at its worst now. The jack walks as though it pained him to raise the leg up high. N. H. C.
Maberly, Mo.

ANSWER.

1. When the spells come on give the following dose: Cannabis indica ½ oz; henbane, 2 drs.; tincture of ginger, 1½ oz.; aromatic spirits of ammonia, 1½ oz.; salicylic acid, 2 drs. Give at one dose in a quart of water and repeat in one hour if necessary.

2. Try to induce the calf to stand on its feet as much as possible while he sucks the cow, and apply hand rubbing to the legs while he stands, to make it gain the necessary strength in the legs. Also rub the legs twice or three times daily with diluted alcohol.

Tuberculosis, Perhaps.

Have had several calves die lately, and upon opening one found ulcers or mattery sores on the lungs, ranging in size from a nail head up to the size of a dollar and upon opening them yellow matter would come out. The calves gradually lose appetite, and finally die. H. B.
Redlands, Cal.

ANSWER.

Have the entire herd tuberculin tested. The above conditions are indications of tuberculosis.

"Just as good?" "Just as good!" Did you say? "Just as good as Veterinary Pixine!!" The dealer who tells you that is mistaken. He does not know.

FACTS AND TESTS PROVE IT!

Emery, Ky., April 9, 1903.

I feel it my duty to tell what Veterinary Pixine did for a horse of mine. He was cut with a knife between the fore legs three inches deep and two inches long, which every minute would gap open. I used several different kinds of remedy without success, even to having some stitches taken. Nothing did any good and it kept swelling and became feverish I almost gave up hopes of getting him well. In the columns of the Ohio Farmer I observed your advertisement and, as it was the last chance, I purchased a box at the druggists and used it as directed and before the box was used up the cut was entirely well. I intend to keep a supply on hand for emergency cases if I have to pay a dollar a box for it. Please accept my thanks for the good I have received from its use, and if you choose you can use my name and testimony.

W. S. CAMPBELL.

This penetrating, stimulating, soothing, absorbing, antiseptic, healing ointment heals from beneath the surface by disinfecting the parts, subduing inflammation and stimulating healthy granulations, not by drying and scabbing, and stimulates growth of hair, natural color. Makes quick, clean and healthy cure; heals stinging, burning, chronic saddle and collar galls, hopple chafes, abscesses, caked bag, cow pox, and hoof rot. It penetrates, stimulates, soothes and heals while horse works. Money refunded if it fails.

How to Detect Trouble with the Separator.

In reply to an inquiry about a separator running rough, vibrating, shaking or pounding, as one might term it, Mr. B. D. White answers in *The Dairy Record* as follows:

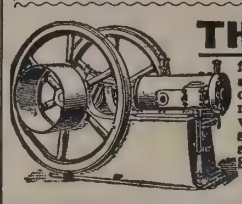
It would be difficult to answer your questions without an examination of the machine, but the first thing to do is to ascertain whether or not the bearing bushings, tread wheel and pin, also spindle and point are worn, or soft rubber ring. If any of these parts are worn they should be replaced by new ones. The separator must be level and not drawn down on the rubber cushions too tight. If you know that all the parts are in proper condition, then the bowl is either out of balance, or the spindle is bent, and in either case it would be advisable to send it to the shop. From the description of the kind of vibration, I should say the upper bearing was worn, or the machine was not level. If the vibrations are slow, the machine is either out of level, the bearing worn, or a soft rubber ring, but if the vibrations are quick and short, that is, the machine is thrown off the center every turn of the bowl, then it is out of balance, or has a bent spindle.

TO FIND OUT WHERE THE TROUBLE IS

Run the machine up to speed, then bring the thnmb or finger nail lightly in contact with the spindle at several points, first just below the upper bearing, then part way down, then just above the spindle head, then on the side of the spindle head. Below that, it would be best to use a lead pencil, bringing it in contact at one or two points. One will easily be able to tell where the vibrations are. If the machine runs smooth at all points except near the upper bearing, then the trouble is all in the bowl, or upper bearing, and the way to tell whether that is worn, or the rubber ring is soft, before putting on the covers, take hold of the top of the bowl and work it back and forth. If there is space between the bearing and the spindle, there will be a pound; if there is not, but the bowl moves easily, then the rubber ring is too soft.

By going over the machine carefully, it is possible for any one to tell what is the trouble.

As He Views the "Dairyman."



ED. HOARD'S DAIRYMAN:—Please find enclosed postal note to renew my subscription. I could not afford to be without the paper. Have done all I could to induce my neighbors to subscribe for it but so far have not been very successful. I consider HOARD'S DAIRYMAN the best farm paper published. As an advertising medium it has no equal. By using a small space in your paper I sold a farm and cheese factory in less than a year. The factory was sold to a man in Ohio and the farm to a man from North Dakota. You see the DAIRYMAN has been my "long suit" the past year.

Marion, Wis. L. D. CHURCHILL.

GOOD INTENTIONS ALONE CANNOT PRODUCE GOOD MACHINERY. Most all manufacturers are honest, but lack the experience and equipment necessary to turn out a thoroughly first class engine. We are the founders of the Gas Engine industry in the United States; have been building **OTTO** engines for 27 years, and operate the largest and most complete plant in the country devoted exclusively to the building of Gas and Gasoline Engines. MENTION THIS PAPER WHEN WRITING.

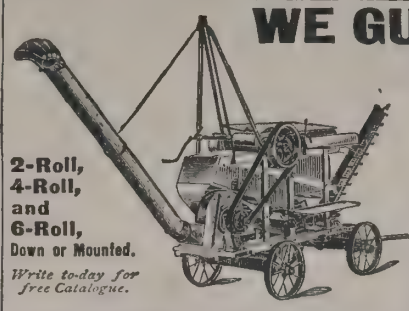
Ensilage Cutters "They Throw and Blow." Pneumatic. "Silo Fillers." Blowers.

These machines cut and elevate with the same wheel at the same time. This wheel has paddles which throw and fans which blow. Without the fans the paddles would throw the ensilage 16 feet high. A light blast of air in addition will blow it to any height. No chains, belts or cogs to slip and waste power. A two-horse tread power will cut and elevate 4 tons per hour, a 10 h. p. engine 20 tons per hour. The easiest running and safest cutters and blowers made. Also cutters and carriers, shredders, silos, engines, horse powers, saw machines, etc. Send for catalogues.

HARDER MFG. CO., COBLESKILL, N.Y.

BLIZZARD

Safe, Strong and Efficient.



Cuts and Shreds all kinds of Dry and Green Fodder and elevates it to any desired height through a PNEUMATIC TUBE. No sprocket, no link belt, no elevator buckets, web, slats, etc. Saves power, breakage and annoyance. It cuts various lengths; any capacity you want. Call at your dealer's and examine it or write us for circulars and descriptive matter, &c

will do more and better work than any other machine of like character and corresponding size on the market; that it is simpler in construction; easier in every way to operate; easier and safer to feed and to require less power for successful operation. The proof of these claims is sent for the asking. We make also a complete line of sweep and tread horse powers, shellers, ensilage and fodder cutters, feed grinders, wood saws, windmills, etc. Remember that Appleton quality is the standard of excellence.

APPLETON MFG. CO., 35 Fargo St., Batavia, Ills.

Quick, Convenient Corn Cutting

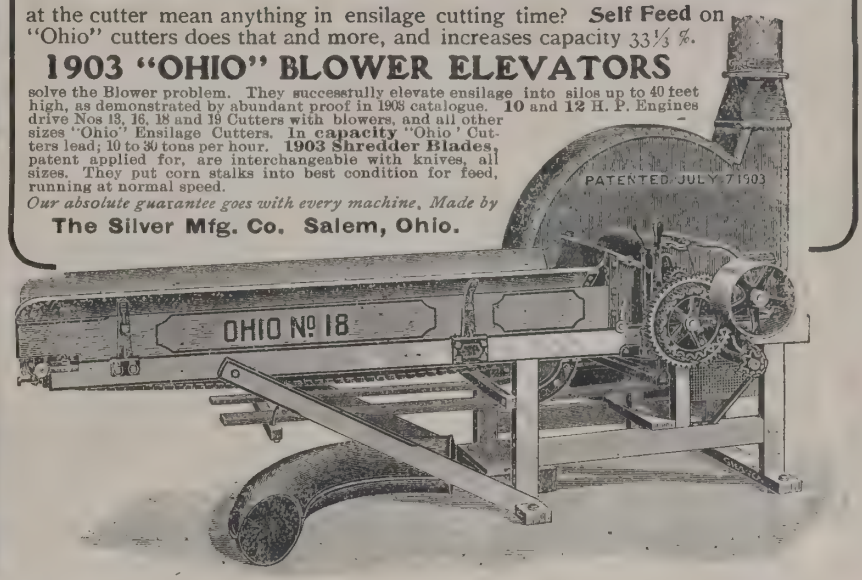
is accomplished with the Scientific Corn Harvester. It saves the crop from field waste and frostbite; does the work of a score of hand workers. Safeguards for man and horse. Too simple to get out of order; too strong to break.

Scientific Corn Harvester

cuts any desired height. Built for the hardest kind of work, but is so low in price any farmer can afford to have one. Illustrated catalogue of Mills, Shellers and Farmers' Tools will be mailed free.

THE FOOS MANUFACTURING CO. Springfield, Ohio.

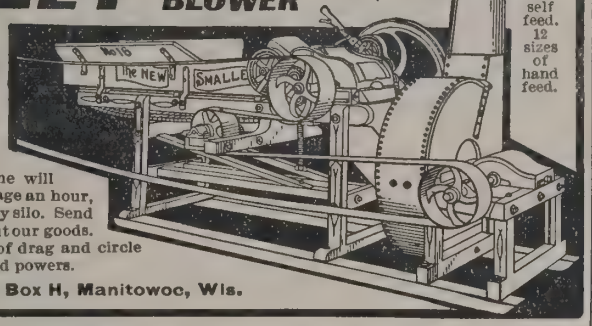
Does Saving ONE or TWO MEN



at the cutter mean anything in ensilage cutting time? Self Feed on "Ohio" cutters does that and more, and increases capacity 33⅓ %.

1903 "OHIO" BLOWER ELEVATORS

solve the Blower problem. They successfully elevate ensilage into silos up to 40 feet high, as demonstrated by abundant proof in 1903 catalogue. 10 and 12 H. P. Engines drive Nos 13, 16, 18 and 19 Cutters with blowers, and all other sizes "Ohio" Ensilage Cutters. In capacity "Ohio" Cutters lead; 10 to 30 tons per hour. 1903 Shredder Blades, patent applied for, are interchangeable with knives, all sizes. They put corn stalks into best condition for feed, running at normal speed.



Our absolute guarantee goes with every machine. Made by

The Silver Mfg. Co. Salem, Ohio.

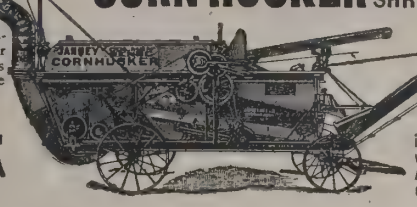
SMALLEY SAFETY BLOWER

6 sizes self feed. 12 sizes of hand feed.

Only One Belt Required.

No lost power. No danger in operation. Belt cannot slip. Every part strong and of best material. No more strain on the *Smalley* machine when Blower is attached than with the ordinary carrier. Largest size machine will easily handle ten tons of ensilage an hour, cut ⅜ inch and elevate into any silo. Send for 1903 catalogue, tells all about our goods. We also make complete line of drag and circle saw machines, sweep and tread powers.

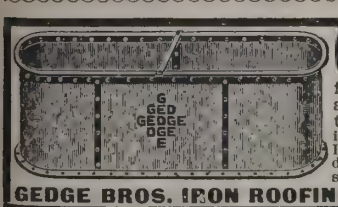
SMALLEY MFG. CO., Box H, Manitowoc, Wis.



SAVE THE WHOLE CORN CROP

A corn crop may be profitable without saving the fodder, but it will be twice as profitable if it is saved. The new method of handling corn saves the entire crop. The new way is to run all the corn through

JANNEY'S PATENTED HUSKING PIN — IT TAKES OFF THE SHUCK



JANNEY COMMON SENSE CORN HUSKER and FODDER SHREDDER

If you feed corn hay you can sell all your meadow hay. You can also bale and sell your surplus corn hay; big demand. You may add further to your profits by husking and shredding for your neighbors. Pays better than a threshing machine and costs less. Eight years in the field; more in operation than any other.

Best made. It husks all the corn and shreds the fodder into "corn hay." Corn hay is the equal in feeding value of best timothy hay Ask your dealer or write us for Husker Catalog.

WILDER'S WHIRLWIND ENSILAGE CUTTERS

Run with Less Power than any Other Cutter.

Have adjustable Cutting Heads and adjustable Table Knives. Solid Balance Wheel with knives and fans attached.

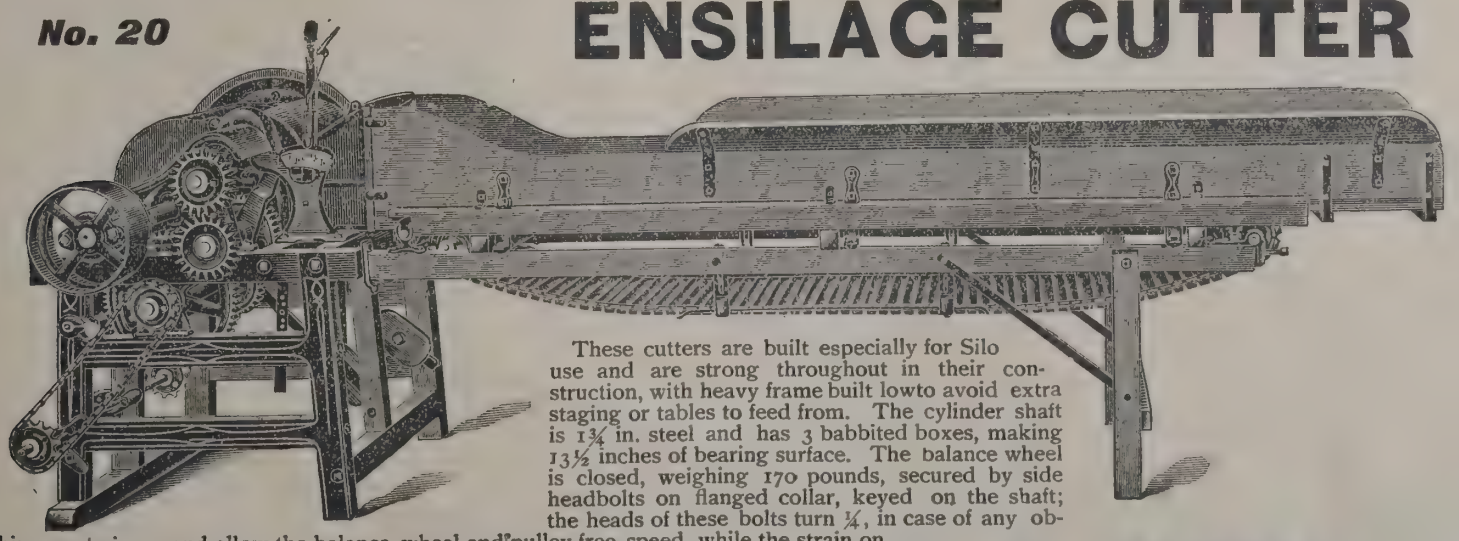
TWO or FOUR KNIVES, or Shredder attachments as preferred. Stop and reverse levers.

Furnished with plain or self feed table.

Read a sample of the many testimonials which we received last year:

CENTRAL DAIRY FARM, Farmington, Ga., Aug. 28, 1902.

GENTLEMEN: The Whirlwind has arrived. Allow me to say you have given it the right name. I had an old 6 H. P. engine to run it with, and it was an old one, having considerable lost motion. When I placed the Whirlwind in motion I had great doubts about my little worn out engine giving power enough, but when I placed the belt on and began to run it I had great fear it would blow the top of my silo off. I never bought a machine that gave such perfect satisfaction. You do not say half as much good about it as it deserves.



Yours very respectfully, JAMES D. PRICE.

We have also a full line of Cylinder Cutters and Shredders with blowers or chain carriers.

Write for catalogue of the MOST complete line of Ensilage and Feed Cutting Machinery made.

WILDER-STRONG IMPLEMENT CO., MONROE, MICH.

No. 20 ENSILAGE CUTTER

These cutters are built especially for Silo use and are strong throughout in their construction, with heavy frame built low to avoid extra staging or tables to feed from. The cylinder shaft is 1¾ in. steel and has 3 babbited boxes, making 13½ inches of bearing surface. The balance wheel is closed, weighing 170 pounds, secured by side headbolts on flanged collar, keyed on the shaft; the heads of these bolts turn ¼, in case of any obstruction reaching the knives, and allow the balance wheel and pulley free speed, while the strain on the knives is relieved at once. The traveling feed table is controlled by the reversible lever and is instantly stopped or reversed. The slats on these tables travel over a close bed, full length and are close together to prevent fine leaves getting into them and winding on the rollers, also guards over the chain links. The length of cut is easily adjusted from ⅜ to ⅝ and ⅞ inches by the gears on the shaft. We furnish chain elevators of any length desired, straight away or side delivery. Weight of Cutters with traveling table, 1600 pounds. Send for circulars.

INTERNATIONAL STOCK FOOD

GROWTH OF MY PIGS WAS MARVELOUS

MOUNTAIN GROVE, Mo., December 7, 1902.

International Stock Food Co., Minneapolis, Minn.

GENTLEMEN:—I have tested **"International Stock Food"** for Horses, Cows, Calves and Hogs and it gave marked results in every case. I had a horse with the farcy, swollen as thick as my hand all over the belly and after two weeks' feeding of **"International Stock Food"** he was sound and well. All my teams have done remarkably well and are fat. My cows also show a large gain in milk and flesh, and it caused the finest growth on a jack colt that I ever saw. My fattening hogs have done the best I ever had hogs do and **the growth of my pigs and shoats was simply marvelous.** A stockman remarked that my thoroughbred hogs were the finest he ever saw. I never expect to be without **"International Stock Food"** for my stock as it makes me extra money.

Yours respectfully, JAMES B. DAKE.

☞We Have Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine and Unsolicited.☜

We own "International Stock Food Farm," which is located 12 miles from Minneapolis and contains 650 acres. We feed "International Stock Food" every day to all our WORLD CHAMPION STALLIONS, DAN PATCH 1:59 ¼ and DIRECTUM 2:05¼; to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. "INTERNATIONAL STOCK FOOD" ☞3 FEEDS FOR ONE CENT☜ is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human system. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these Medicines promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High-Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Fifty Thousand Dealers throughout the World. ☞Your Money will be Promptly Refunded in Any case of failure. It will make your Calves or Pigs grow Amazingly and has the largest sale in the World for keeping them healthy. ☞Beware of the many Cheap and Inferior Imitations. No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or a Falsifier.

CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

ROYAL MANUFACTURING CO., Box 1110, Detroit, Mich.

D. M. Osborne & Co., St. Louis, Mo. Caledonia, Mo, June 1, 1903.

My Dear Sirs—I feel I honor my own judgment, and reflect only that which is justly due your corn harvester, when I say it is without doubt the best corn harvester on the market to-day. Last season I cut, on my own farm, 115 acres of corn, and a negro boy 16 years old managed the machine, drove the horses and did all the cutting, without one cent expense for repairs or breakage. The work could not be excelled. The corn was heavy and much of it down, and some full of weeds, but it made no difference to the machine. All corn looks alike to an Osborne Corn Harvester, and to Missourians your machine is peculiarly adapted, for it can most certainly "show them." I am, Yours very truly,

W. R. GOODYKAUNTZ,
Ex-Senator of Missouri.

OSBORNE

This Corn Book tells about Silos and Fodder. Book Free for the asking.

Scotia, N. Y., April 15, 1903.

D. M. Osborne & Co., Auburn, N. Y.

Dear Sirs—I am well pleased with the Osborne Corn Harvester I purchased of your agent, C. H. Bevis, last fall. It proved to be all it was recommended. On account of the season, several places in our corn fields were deep mud, but where we cut there the machine worked just as good. The broad-faced steel drive-wheel is a great advantage on ground where it is soft. We used only two horses, and did the work easier than some of our neighbors did with three horses on another make of machine. It is certainly a very light runner. It is also a fine binder, never once having broken the twine, or missing to tie, thus using less twine than others, besides delay and trouble. I would say, in a word, that the machine is practically perfect. Very truly yours, CHARLES P. SANDERS.

WHAT'S Chopped Cream?

It's the product of old style, top-heavy separators—the kind with a bucket bowl which looks like an inverted potato masher. You'll know them—they have a big head on a slender stem. The stories the manufacturers tell about them are as full of impossible promises as the bowls are full of antiquated nuisances.

These inside contraptions—called discs, cones, vanes, pie plates, graters, etc.,—were introduced by the manufacturers in a frantic attempt to make their machines skim decently. Look into a bucket bowl—it will amaze and amuse you. They are curious things—hard to use and harder to clean. They try a man's patience—whip, cut, chop, churn and taint the cream—produce inferior butter.

You can avoid all these troubles and waste of power, cream and repair money by using the only separator that's different.

The Tubular Dairy Hand Separator.

It's the machine of to-day—simplicity itself—has made "has beens" of all others. It has enclosed self-oiling gears—low supply can—light ball bearing tubular bowl containing one tiny piece, and that removable, to guide cream out of bowl. Back of the Tubular are wonderful records for capacity and perfect skimming.

When you write for our handsome free catalogue ask for No. 144.

Rennet Tablets for Scours.

ED. HOARD'S DAIRYMAN:—When we began to raise high grade Jersey calves, we were subject to considerable annoyance and loss on account of that scourge of calf life commonly called scours. The remedies usually employed were of no benefit, and after much experimenting it occurred to me that the ailment being the result of indigestion, the use of predigested food would be a reasonable solution of a difficult proposition. Accordingly I procured a box of rennet tablets, such as are used for cheese making, and used them as follows:

Presuming that the animal retained some digestive powers, I added to the milk to be fed one-half the amount required to form a curd. Thus, if one tablet is sufficient for 50 pounds of milk for cheese making, it will suffice for 100 lbs. of milk for calf feeding, and 1-16 of said tablet (approximately) is the proportion required to add to 6 pounds (3 quarts) of milk, which is the average amount given to our calves at three to four weeks old. The rennet is dissolved in cold water, as per the directions accompanying the package and added to the warm milk at the moment of feeding.

If the animal seems to be in pain, I add a few drops of laudanum, not to exceed 15, and a level teaspoonful of powdered ginger root, simply as an alleviator. The milk is fed warm from the hand separator, in clean pails, and at regular hours.

We have practically no trouble of this kind now.

As I intimated at the beginning of this article, it arose at first from overfeeding, the Jersey babies being more delicate than the larger, hardier breeds we had handled previously.

I was led to try this form of remedy by my personal experience with pre-digested (peptonized) milk, and by my observations of its beneficial effects upon others who were afflicted with certain forms of indigestion. (MRS.) L. E.

Chippewa Falls, Wis.

A good illustration of the old proverb that "an ounce of prevention is better than a pound of cure" and also of the fact that woman's care, judgment and personal experience count for much good to bovine mothers and babies.

Siloing Whole Corn.

I am tempted to try putting corn in in bundles as I have no roof and will not have until after filling. I could put up a temporary track and use a sling carrier which I have, part the load by means of stakes in the rack, and put the slings on these stakes.

I think that in winter if there was any trouble in getting it out one could use a hay knife and cut it as much as necessary.

I liked G. M. Clark's article on grass in the current issue and sent for his circular. Success to the DAIRYMAN. G. L. S.

Dane, Wis.

It is quite possible to make good silage from corn in bundles, but they must be carefully laid down, as in stacking wheat or oats, and special pains taken to make the outer edges as solid as possible. To make successful silage, practically all the air must be excluded. It is difficult enough to do this when the bundles are laid in carefully, but when thrown in miscellaneously, it will be quite impossible. A silo is practically a large fruit jar and the housewife's practices in canning fruit, and especially in excluding the air, must be as closely followed as circumstances will permit.

We fear there would not be much success in attempting to cut well settled silage with a hay knife. We have done it sometimes in our old silo, cutting down a strip at a time, as we used to cut the hay down in the barn, but it did not prove very successful, and was a very laborious job.

Milking Machines.

Can you put me on track of a milking machine that is a success? I have seen one that is self operating after using the air pump 2 or 3 minutes, but have not been able to see it work and cannot find where it is manufactured or what it is called.

Oxford, N. Y. A DAIYRMAN.

A perfectly successful milking machine is yet somewhere in the future, we fear. There are machines at present, which, according to reports, seem to do very good work, at least for a time, but apparently, the manufacturers themselves have not sufficient confidence in their success to justify advertising and pushing sales with guaranty of satisfaction.

Prof. Henry at the Georgia State Dairymen's Association.

Ed. Hoard's Dairyman:—Last week the writer attended the annual meeting of the Georgia State Dairymen's Association, held at the seat of the state university, Athens. Athens is a beautiful city of ten thousand people. The university is doing a most useful work. Being over one hundred years of age, many interesting events are molded into its history.

There is always a zeal and earnestness characterizing a new human enterprise which is often lacking in things of the same kind when age creeps on. In attending the meeting of the Georgia dairymen one is impressed with the intense earnestness and eagerness of the members for help and hints. No matter how well one may have done, he does not seem satisfied, but wishes to know more and to do better. This earnestness and eagerness and zeal impressed me strongly as I looked into the faces of these intelligent, progressive people. What could have charmed me more at this meeting than to hear oft repeated the name of "Hoard's Dairyman" and the name of its proprietor. These are household words with Georgia dairymen. No man is so loved and revered by the dairymen of the southland as is W. D. Hoard. When one mentions Wisconsin the people immediately speak of "Hoard."

The dairy interests of Georgia are, as yet, not large. The cotton crop made by the negro and the mule is the subject of conversation with nineteen people out of twenty, and yet one can see great possibilities for dairying in north Georgia. I wish I could impress upon the minds of Dairyman readers some of the things I saw in my visit to the farm of Mr. W. L. Williamson, President of the State Dairy Association, Harmony Grove, north Georgia. The country there is elevated, giving pure, cool water in the wells. While cotton is generally grown, dairying is certainly a general possibility. Mr. Williamson, a dozen or so years ago, took possession of a worn out cotton plantation, and began dairying in a small way. Today he has about eighty head of splendid Jerseys, mostly registered. His cows are large, and show vigor and good constitution. At the time of my visit they were grazing on a well-knit Bermuda grass pasture.

Do northern readers generally know that until comparatively recent times the south as a whole has been without a sod grass? From Washington to Florida and from Florida to Texas there has been no grass which would make a close-knit sod like our blue grass. The limestone region of Kentucky and Tennessee is the only exception—blue grass flourishes there. But there came to the south in some unknown way a stranger grass which is destined to work a revolution of untold value. Bermuda grass (the southerners call it "Bermooda") is a fine, delicate grass which spreads not by seeds in the southland, but by runners, much as does the strawberry plant. These runners joint every four or five inches and will travel from one to three yards in a season. The Bermuda grass is spread over the fields by digging up the sod, chopping it into bits with the spade and burying these little pieces lightly in squares from two to three feet each way. In a year or two the whole field is covered, for this grass never ceases growing and spreading. The land of north Georgia is less fertile than the good lands of southern Wisconsin.

Many of the fields have been so long cultivated in cotton that the fertility is largely exhausted. Some of these lands will not bring over six or eight bushels of corn if planted to that crop without fertilizer. Indeed, there are lands which will hardly bring any corn at all. But the Bermuda grass seems to pay no attention to fertility as measured by other plants, but spreads and grows as though every condition were favorable. Mr. Williamson knows the value of Bermuda grass and is getting large returns from it. On good land a single acre would easily keep a cow during a long pasture season. I found his stable large, airy and very clean. The cows are kept in Bidwell stalls, and have individual drinking vessels. The manure is carefully saved and usually spread on the fields as fast as made. Sorghum is one of the great forage and hay crops. A field near the stable was turning out several large two-horse wagon loads of dry sorghum forage to the acre—about as much as we could produce in Wisconsin on land that sells for several times as much per acre.

In the South corn is planted one stalk in a place, the rows being four to five feet wide. The stalks are from 18 inches to three feet apart in the row. The poorer the soil the farther apart the stalk must be planted. If planted too closely, the corn leaves roll up, turn yellow, and a poor stalk without even a "nubbin" on is produced. Planted rightly and nourished fairly well, the stalks grow about 30 or 40 per cent taller than with us. Georgia corn does not average over 12 bushels per acre, but Mr. Williamson can grow from 20 to 40 bushels—and this too on a farm which a few years ago would produce practically nothing.

Two Jersey bulls were fastened in an out-of-door pasture in a manner that interested me greatly. A heavy wire was drawn about ten feet high between two trees a couple of hundred feet apart. From this wire another twelve or fourteen feet long led to the ring in the bull's nose. Thus secured the bull could walk back and forth between the two trees, having quite a strip of grass to feed on. How much better than to keep him in a box stall or shut him up in a prison-like bull pen made of planks close together. In such prisons the creature cannot see out and this tends to make him wild and ferocious the same as does chaining a dog to the kennel.

Butter at the Williamson farm is made in a creamery, the churning room of which is located in a well lighted cellar. This and an abundance of pure, soft water keep the butter cool so that no ice is used. Another favorable factor is feeding cotton seed meal, which tends to make the butter "stand up." I should not fail to mention that Mr. Williamson weighs the milk of every cow in the stable at each and every milking throughout the year. Twice a month samples are taken for analysis. For a year the fat has averaged 5.1 per cent for the whole herd. For about four summer months his butter brings 21 cents per pound wholesale, and the rest of the year 26 cents per pound. Milk wholesales for about 20 cents per gallon, or say five cents per quart.

Best of all, among the good things seen at the Williamson farm, were the two sons, both interested in dairy matters. These boys had on their denim suits and were busy at work with the stock. This stands in strange contrast with many of the southerners, who think that gentlemen should have soft hands, wear high-priced clothing, and do little or nothing in the way of manual labor. The future of young men who will travel the path of these young men is bright, and one can predict the outcome as certainly as that the sun will set at even-tide. One of the sons said: "Father is always reading Hoard's Dairyman," and one can see the effects of its teaching in many directions. One point of great interest on these farms was its great betterment from the devastating work of cotton culture. Cotton growing means not a weed left in the field, and the same crop—cotton—year after year on the same land.

In the south it rains more than with us here in the north, and the soil tends to melt away. Where the land is at all uneven, great gullies are washed through the fields. The soil is red from the iron it contains, and these red gashes in the earth can be seen miles away in many cases. They are a feature that gives one the horrors. Japan clover and Bermuda grass will grow on the sides and bottoms of these gashes and trap the earth as it washes down, causing the depressions to fill with earth a few inches each season. All this will be done if the planter will only allow these crops to do their work. Mr. Williamson has aided nature and now drives the plow and wagon over places that were deep with gullies a few years ago. A beautiful, productive farm is being built up where, a few years ago, was a worn-out plantation. Let any northern man who thinks of locating in the south, and is hesitating as to what can be done, visit Mr. Williamson's farm, and he will soon be convinced of what is possible. Flies bother the cows far less than I had expected; indeed, there was not one fly pestering these cows where there were twenty discernible on herds observed from the car window when Wisconsin was reached.

My visit to the Williamson farm was in company with that prince of entertainers and old-time mutual friend, Col. I. H. Wade, now of Cornelia, Ga. As Industrial Agent of the Great Southern Railway, Col. Wade has done an enormous work in building up southern manufactories. His interest in dairy matters is as intense now as it was in the days when he owned a magnificent Holstein herd in North Dakota, two decades ago. Many northern cattle men will remember Colonel Wade's exhibits of stock at the various state fairs.

I accompanied Colonel Wade to his pleasant home at Cornelia, Hebersham county, northeast Georgia. Here is an almost mountainous region possessing a peculiar charm. I was captivated at once with what I saw. Peach growing attracts the most interest just now, and what luscious fruit they grow here in the mountain air. I brought home specimens, four of which placed side by side covered a foot space. But this region is equally a dairy region. Cattle will flourish here to a surprising degree. I saw little patches of Bermuda grass, of an acre or two, that were supporting two to three cows comfortably during the long pasture season. The pure, wholesome air, the cool, numerous springs and brooks running through every farm impressed upon me that nature had meant this not for a land of peaches and other fruits alone, but for cattle as well.

Lands are very low priced. One plantation with a fine house, having a grand view of the Great Blue Ridge Mountains and some good land with beautiful brooks and enticing springs of pure, cold, soft water was offered at about $13 a acre. Lands still covered with trees can be had for half that sum. Georgia people are anxious for northern capital and northern enterprise. In the region of which I speak the colored people are few, the white people neighborly. It is certainly a region well worthy of thought from those who wish to seek a milder climate than can be found in the north. The Georgians are warm-hearted, hospitable people. Among the choicest memories of my life will be my visit during the summer of 1903 to Athens and north Georgia.

Crumbly Cheese and its Causes.

A reader at New Washington, Ind., writes as follows:

I am having some complaint about my cheese crumbling so very much in cutting it. I make nothing except full cream, fancy goods and I aim to make them rich as I can. Could you give me the cause of it, or a remedy for it? An answer through the Dairyman might be of benefit to others, as I am sure it would be to me.

Wishing to submit a full and authoritative answer to this inquiry, it was referred to Prof. U. S. Baer, of the Wisconsin Dairy School and for several years one of the travelling cheese instructors employed by the Wisconsin Dairymen's Association. His reply below covers the whole subject and, as suggested by the inquirer, may prove serviceable to other cheesemakers who may sometimes have similar trouble.

Ed. Hoard's Dairyman:—In answer to the question asked by your Indiana correspondent, would say that there are several causes for cheese crumbling under the knife. The most common cause is too high acid in the manufacture, which injures the texture, giving the cheese a dry, short, mealy body.

Cheese too highly salted will be dry and crumble easily in cutting.

Curds firmed at too high temperatures or where insufficient quantities of rennet are used to break down the cheese properly, will be tough and corky while new, but dry, loose and brittle when cured.

High rennet cheese, ripened at high temperatures, invariably develop a rough, mealy, salvy texture.

The finest cheese curds, produced from the choicest milks, made up in the most skillful manner, will cure into a miserable, loose, open-bodied product if placed in a curing room at temperature above 60° F. for any length of time.

While flavor stands first in importance, the texture of a cheese comes next. The texture as shown on the trier or the knife should be smooth not fuzzy. If the cheese is new, the piece should bend a little before breaking. When fully cured a piece broken from the cheese should not crumble off, but show a surface smooth as flint, and is termed "a meaty-bodied cheese."

When pressed between the fingers it should not be stiff, curdy, gritty or mealy, but mold up like wax, smooth and silky with a full, close, creamy body. When held between the eye and the light the color should be straight, uniform and clear, or slightly translucent.

An uncolored cheese should be of a light amber color. If it is a dead, chalky white, it is so because excess acid has cut the color out of it.

U. S. Baer,
Wisconsin Dairy School.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

JOHN C. Godfrey, Pennellville, New York, announces an auction sale of Holstein-Friesians to take place at Fulton Fair Grounds, September 17th, 1903.

BREAKING A HEIFER TO MILK—TO PREVENT KICKING AND HOLDING UP THE MILK.

There are many ways of doing the same thing on a dairy farm. No man can absolutely say his way is the best, for the circumstances may differ slightly, and we know of old, that "circumstances alter cases." But the question of breaking a heifer to be a kind, gentle milker, and give down her milk easily and regularly, is a "circumstance" we all desire greatly to come to pass. When the contrary happens, and heifers are often contrary, then any man's experience is valuable to consider. We may say that there is one thing or "circumstance" that should always exist: patience and uniform kindnee. It will always help out the problem very greatly if the heifer has been well and frequently handled before calving. In that little book, "Thirty Years Among Cows," (thousands of which have been sold from this office), the author, N. B. White, tells of his experience and methods in the education of heifers to become tractable milkers.

When he starts in with a heifer, he aims to make her forget her calf as soon as possible, and transfer her attachment to the milker. To prevent her taking on the habit of kicking and moving about when being milked, he uses a leather strap a little longer than a hold-back strap to a harness. This is put twice around the hind legs above the gambrel and buckled. The heifer will struggle a little at first, but will soon give up. This method enables the milker to accustom the heifer to be milked with both hands from the start. When she is thoroughly broken, the use of the strap can be discontinued.

Another good way we have found, is to draw the head of the heifer up rather high, fasten it there and proceed with the milking. It is hard for an animal to kick when the head is held high. In the same connection, Mr. White speaks of overcoming the bad habit of holding up the milk, which is a frequent thing with cows. He reasons that this first proceeds from some mental disturbance. It is quite apt to occur with heifers when they are separated at first from their calf. Anything that will cause them to forget their trouble will bring down the milk. To do this he puts a little savory hay or bran before the heifer when he commences to milk her, and the work is done. When once the habit of being milked is established, then the feeding at milking time may be discontinued. As a rule, dairymen are opposed to the practice of having feed before the cow while she is being milked. Yet we know of some very successful dairy farmers who make a practice the year round of filling the manger or rack with hay regularly before milking time. They claim that it quiets and contents the cows, and causes them to give down their milk much better. We think there is no doubt about the latter fact, for several times in our own experience with cows that held up their milk, a little feed at milking time would correct the difficulty with certainty.

WHEN TO BREED HEIFERS.

With those who value size principally in their cows, the theory and practice is not to breed until the heifer is 20 or 24 months old. There is no doubt that the heifer will make a larger growth under ordinary treatment if bred at such age, but there is danger in this method in our estimation, of promoting a beefy tendency in the heifer. With dairy cattle, the main purpose is to promote as much as possible, a predisposition to milk giving. For this purpose we breed for milk, feed for milk, and in the care and handling we give the animal, we endeavor to promote the milk giving function all we can, consistent with health and constitution. It has been noticed by close observers, that if heifers, or cows even, become too fleshy they are apt to fail in breeding, or if they do conceive and have a calf, there occurs some how, a "set back" to their full and free milking function. "Fat and fertility are at the antipodes of each other" says the author of "The Transmission of Life."

When heifers are kept till they are two-years of age before being bred, they are quite apt to contract a fleshy habit or tendency. But, if the process of gestation is going on with them at the same time, it counteracts the flesh making tendency, and establishes the milking temperament within them. It is true that the bad results of late breeding in checking the milking tendency are not near as apparent in thorough-bred dairy cattle, as they are in dual-purpose or beef cattle The reason for this is that the "dairy temperament" is more thoroughly established in them, by long heredity in that direction, and so holds them more steadily to the central purpose for which they are bred. But there is a constant tendency to "reversion" in the very best of families.

So if we keep alive and strong the dairy temperament, we should start the heifer in that road, as soon as she is 15 months of age. What we are after in this matter of breeding dairy cattle is to constantly establish and enlarge the dairy individuality of our animals. We like to feel that all our methods of breeding, feeding and handling are doing their best to make of each heifer, if possible, a little better cow than her mother. That is the road of dairy progress. Branching off from it and leading away from the great central purpose are other paths, such as "dual-purpose," the "color-craze," and an uneconomic demand for "size," etc.

A writer in the *Jersey Bulletin* of July 29, speaking on this question, says:

"We like them (the heifers) to drop their calves at two years of age. Would prefer them to freshen at twenty months than to go over two years. Heifers bred ever so early with us give from 28 to 32 lbs. per day, and improve generally until the third calf. To be sure they will not get their full growth until they are four or five years old, and possibly may never be quite so large as if they dropped first calf at three years, but most of us know that size does not stand for every thing in a Jersey cow."

Sufficient size, say 900 to 1,000 pounds, can be attained more surely by seeing to it that the heifer is kept growing and thrifty from the time she is born.

One of the finest feeds for conditioning and promoting growth in heifers and young cows is alfalfa. The first 12 months of the calf tells the story of its subsequent growth almost invariably. Fresh skim milk, separated on the farm, fed morning and night, with a spoonful of blood meal and a pint of oats, followed by what good alfalfa hay it will eat, and dry, clean quarters, will make a heifer fully large enough to breed at 15 to 17 months of age, and we believe she will make all the better cow for being started in the way of maternity at that age.

MR. A. SLAUGHTER'S IDEAS ABOUT DAIRY BARNS.

At the Ohio Dairy Convention last winter Mr. Slaughter paid his respects to the average dairy barns of Ohio as follows:

"It is true there are many conditions which enter into the complex subject of the production of milk; there are many things which enter into the environment of the cow. Her home—the barn which is built for her—is just about as suitable for her domicile as I would be to be a judge of the Supreme Court of the United States. These barns are built with no thought of any sanitary drainage, or ventilation, or anything else that would tend to enhance the health of the cow. They are simply built because they are cheap. You will find them all over the country * * * *.

If you should visit some of the barns which I have visited within the last year—barns belonging to men who thought they had one of the finest barns in the country—and in the morning open the door and step in and be met with the stench that comes belching from the interior, you would not be surprised that the cows do not do their best."

Mr. Slaughter's description is not over drawn. Not only in Ohio are there such barns, but we may say that in every dairy state in the Union, a healthy, well ventilated barn is a tremendous exception to the rule. It is a reproach to the common sense, to the humanity, and to the intelligence of any farmer to persistently keep cows in such barns. But more than that, it is an open indictment of his business sense. The farmer who thinks his cows will do their work as profitably in such barns as they will in one where they can breathe pure air shows that he does not understand the forces he is dealing with. He forces his cows to live in a barn which will poison their bodies, reduce their vigor, and make them an easy prey to disease. Is it reasonable to suppose that cows in such conditions will turn out as much milk as they would in pure air?

Yet, for small cost any man can put the King system of ventilation in his stable and automatically furnish his cows as pure air as they breathe in the open field. The HOARD'S DAIRYMAN barn has room for the housing of fifty cows. It cost about $350 extra to put in the King system. Shut the barn up tight at night and open it after twelve hours, in the morning, and it will be difficult to discover the ordinary odor of a stable there. The foul air is drawn off constantly by the big three feet square shaft in the center, and the fresh air is pouring in from thirty openings on three sides all the time.

Take a stable with fifty cows and compute how much foul, poisonous air they will deposit in such a room over night if it be kept warm. If it is not a warm stable there will be great loss in milk. Now this foul air being heavier than common air, sinks to the floor. The cows lie down in it, but are soon distressed for breath and get up again. They are not given the rest they need and they take revenge by cutting down in the milk return. Meantime the owner, blind to all knowledge on this subject, is pouring in costly food to his cows and wondering why he does not make more money.

The plainest common sense would seem to dictate that every farmer should give his cows just as pure air in winter as they get in summer if he expects them to do profitable work. We can poison ourselves or our animals just as effectually by foul air as we can by foul water or food.

CONCERNING THE DANGER OF IMPURE MILK.

As a rule the farmers who produce milk do not give much thought or study to the scientific side of milk production. With most men, milk is milk, the same as a cow is a cow. Yet if we get at the great body of facts that concern milk, we must have recourse to scientific study. While milk in its pure state, is one of the most beneficent of foods, it can be easily made one of the most dangerous of poisons, a conveyor of disease and death. The miscroscope and the study of the germ theory has unfolded to the student a vast domain of knowledge which the ordinary milk producer knows nothing of, nor is he likely to, if he rejects all information that comes to him, or is unwilling to learn or believe what men of science tell him.

"Every man gives of his own measure," and to know how much he will give we have only to take his measure. The man who cares nothing about informing himself concerning the scientific side of his business, especially when that business is the production of food for others, is not safe to be trusted with other people's lives. It is for this reason that it has been found necessary to organize boards of health, enact strict laws and thus compel the milk producer to come within certain rules in the handling of his milk. And yet a vast amount of unhealthy milk finds its way to market.

John D. Rockerfeller lost a little grandson, John Rockerfeller McCormick, through scarlet fever conveyed by milk which was infected with the germs of this disease.

Mr. Rockerfeller at once devoted a portion of his great wealth to the founding of what is known as the Rockerfeller Institute for Medical Research, at New York. It has long been known that the mortality among children in the cities is out of proportion with the deaths in the country. The Rockerfeller Institute set to work to learn why this is. The first report of this institution has been made and from the same we cull the following which is taken from investigations concerning the milk that goes to New York city.

"Milk from carefully groomed cows in clean stables, when taken under the best precautions now possible, cooled immediately to below 40° F., and kept at that temperature during the transportation, by proper icing, and sent by express trains to the city, although handled with every precaution against contamination, contains, when it reaches the consumer, from 10,000 to 100,000 bacteria in each teaspoonful. This for the best milk.

MILLIONS OF BACTERIA FOUND.

"Now, what of the worst milk? During last summer the milk sold in the groceries of the tenement districts contained, as shown by the examination made by the bacteriologist, from 4,000,000 to 600,000,000 in each teaspoonful, and just such milk as this was fed last summer to many infants in New York.

"The germs which cause various infectious diseases, such as typhoid fever, scarlet fever, diphtheria, tuberculosis, etc., live and some rapidly multiply in milk. Every year a number of outbreaks of these diseases occur, which have been traced to milk contaminated by ignorant or careless milkmen, who have infected their milk by their dirty hands or the dirty water, or in other careless ways.

WORST PRODUCT NEAR CITY.

"If milk is transported long distances great precautions are taken to preserve it, while if transported from adjacent counties, hardly any attention at all is paid to it. Thus it comes about that some of the worst milk delivered in New

York is brought from the nearest places.

"The worst conditions were found along the line of the Harlem road. Fully 10 per cent of the milk carried by the Harlem road during the hottest months was never iced at all. Milk handled in this way in hot weather is often so changed that it is unfit to be sold."

"The health departments of the state and city should have the right to inspect farms, the report says, and demand those things which are necessary in order to produce a wholesome milk and to exclude contagious disease.

CERTIFICATION THE SOLUTION.

"Milk certification at the present time seems to be a solution of some of the difficulties in this problem. Such an assurance is now provided in a certificate issued by the City Medical society, which is given in two forms. When they find it possible to assure themselves that milk is produced under wholesome conditions they grant to such a dealer permission to employ a label: "Inspected by the Milk Commission of the Medical Society of the County of New York."

"For those persons who can afford to pay somewhat more for their milk, a still finer grade is provided. Not only are the conditions detailed above carried out, but the cows are groomed, the udders are washed, and the men wear clean garments during milking. All utensils are sterilized and regular inspection by experts is continued. The jars containing the milk have on them a label: Certified by the Milk Commission of the Medical Society of the County of New York."

July Record of a Scrub Herd.

ED. HOARD'S DAIRYMAN:—Your reply to M. F., Fairhaven, Vt., July 31st, was unsatisfactory and unkind. The correspondent in my opinion, is doing quite well with his cows. This herd of 10 cows gave 5,971 pounds of 4.8% milk in the month of June, on pasture without grain, an average 19.9, or probably 20 lbs. of milk per day, equivalent to one pound butterper cow per day. If there are many other herds doing better under such conditions, I would like to know about them.

If the Editor's herd is doing better, even with a fair grain ration, taking the average of the herd, we would like to have the statement, in black and white, out their own salvation in the pastures. If, Mr. M. F., your herd is not up to modern requirements, console yourself with the fact that there are more than 900 other cow keepers in every 1,000 who are not doing as well.

No doubt by this time M. F. is feeding some sort of meal ration and his cows are yet producing for him some 19 to 20 lbs. of 4.8 per cent milk daily. My advice therefore, is for M. F. to stick by those 10 cows, and as the pasture dries up, supplement heavily with fresh cut green feed and a daily grain ration of 5 to 10 pounds, given morning and evening, and no mistake he will tell the readers of HOARD'S DAIRYMAN, next May, that his 10 cows brought him a good, annual profit.

I am considered, myself, a fairly good dairyman and my cows do very little better than this. My six cows, during the month of July, just passed, have but a small mess of milk.

During the month of July we obtained a total for the month, from our six cows, of 3,815 pounds milk; average 4.6 per cent butter fat. While this is by no means phenomenal, it is a good, satisfactory yield and much better than 99 out of every hundred factory patrons we know of, and not very much better than our friend, M. F., of Fairhaven, Vt.

Probably if M. F. fed and attended to his cows as well as we do, he would do even better. This, mind you, is a record for thoroughbred scrubs. Our friend, M. F. has grade Jerseys. We doubt if there is the tenth part of an ounce of Jersey, Guernsey, Holstein and Aryshire blood coursing in the veins of our six cows. They are pure bred scrubs, if such they may be called. I have nothing to say against those dairymen who are chasing after pure bred dairy animals, only this, if little more attention was given to calf rearing and to the dairy, and to feed and care of the cows, when they come in milk, there would not be such a scramble after this fetish of pure bred dairy animals.

They tell us that milk giving is a nervous function, not a physical one. Then why should any particular ration have the monopoly of milk giving. We never learned that the bovine mothers of North Germany, of Jersey or of Ayrshire, possessed any superior milking or motherly qualities over their sisters of Aberdeen, Galloway, Durham, etc, and we don't believe they have. Milk giving is a maternal function, and no one breed, herd and locality possesses it in either the bovine or human races. Give me the calf from a deep milking mother, I care not her breed, and I will make a good milk cow of her, irrespective of breed and nationality. I am now able to give a detailed report of our July record and it is as follows:

A Comparatively Cheap Dairy Barn, yet one of the Best Lighted, Best Ventilated and Most Sanitary in Illinois.

JULY MILK RECORD, JULY 1-31.

Cow	Description.	Pounds milk.	Pounds fat.	Equivalent Butter, lbs.
No. 1.....	24 months	682	29.14	34.
" 2.....	6 years	1,054	44.02	51.
" 3.....	5 years	806	32.24	37.6
" 4.....	Stripper	279	16.12	18.8
" 5.....	15 years	589	29.42	34.3
" 6.....	2nd calf	434	24.18	28.2
6.....	——	3,844	175.17	204.
Per cow, per month.....		640	29 19	34.
Per cow, per day., ...		20.7	.94	1.1

When we consider the makeup of this herd we are quite satisfied with their output. No. 6 is the only cow we are in doubt about. She is now in her second calf and ought to be giving more milk than she is giving. However, her milk is very rich in fat, and if we find her to prove a persistent milker she stays. If she dries up easy we shall have to get clear of her. Our old 15-year-old cow is doing well. She is very thin in flesh, however, seems to put all her food into the milk pail, and if she does not get on flesh pretty soon we shall have fears that she will not winter. Our No. 1 is worthy of more than passing notice. Only yet 24 months old, she bids fair to be a phenomenal cow, and shows in a striking manner the virtue of oats—dry oats—as milk food.

This little heifer has never yet ate any other grain than whole oats; in fact, she will not take kindly to any other. She has been getting oats since she was five months old, and she has gotten oats every day since. She is a daughter of No. 2. The grandmother was butchered last fall at 16 years of age and was a good cow. While butchering her we found a calf in course of development. We made a mistake in killing this fine old cow, as she was by no means worn out. The old cow however, breeds on, in her daughter, No. 2, and granddaughter, No. 1, notwithstanding that she was a scrub, pure and simple, without admixture of any recognized breed. J. A. M.

P. E. I.

Portion of barn on right is a stable for 36 cows. No provision for light or ventilation. Openings shown are covered with boards in winter. Mud-hole in yard. Marks on barn show where manure has been piled.—Report Illinois Experiment Station.

and he is certainly warranted in looking down from his high pinnacle upon the army of less progressive dairymen. Yes brother M. F. do not be alarmed. Your cows are doing quite well, and you need not be in haste to bring the butcher along, to weed and decimate your very good working herd.

No doubt many of those ten cows are some months in lactation, some perhaps twelve months or more. No grain is being fed to those cows. They simply eke milked but an average of a little better than 21 lbs. per day of milk of the same quality as M. F.'s, 4.8 per cent, and I am satisfied they are doing well enough for July heat and flies, though getting a semi-daily meal ration of 5 to 8 pounds.

Here is my July statement. Consider first, however, that in this herd of six cows one cow was 15 years of age, and shows it, and another 24 months, while another is a stripper cow some 30 months in lactation and naturally gives

American Short-Horn Herd Book.

We have received Vol 55 American Short-Horn Herd Book containing pedigrees of bulls numbered from 194184 to 198415 inclusive, also pedigrees of 7191 cows. The book is now ready for general distribution the price $3.00 or $3.30 prepaid. Vol 56 is now in the hands of the printer and pedigrees are now being filed for Vol 57.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Cost of Producing Milk.

I would like to have some information as to the cost of producing milk. I notice that some writers claim that about two cents per quart is cost of production. If that is true how can farmers afford to dispose of milk at a dollar per hundred or thereabout? I am informed that dairy communities are prosperous, etc., but at above price it seems a very small margin of profit.

Probably this is an old discussed question, but I, being a new subscriber, have not seen discussion of the subject in your paper if there has been any. C. M. W.

Hortonville, Ind.

At the Wisconsin Dairymen's Convention, last winter, Mr. Gurler exhibited a table showing the cost to him of keeping his cows and the amount of milk produced. A stable of 50 cows showed a milk production of 5,708 lbs. per cow, the cost of feed was $41.06 per cow, making the feed cost of milk to him a trifle less than 72 cents per 100 pounds. The best four cows in this stable of 50 cows produced 9,098 pounds of milk each, and the cost of feed was $44.95 per cow, making the food cost of milk just about 50 cents per 100 pounds. The four poorest cows averaged 3,020 pounds of milk and cost of feed was $33.96 per cow, making the food cost of milk with these poorest more than $1 per hundred pounds.

It is, however, not to be forgotten that the feed was charged to these cows at market prices—such as was bought, at what it cost delivered at the barn, such as was raised, at what it would bring in market, and no account was made of the benefit to be obtained from the residual manurial value of these feeds in keeping up the fertility of his farm. This is an item too frequently forgotten by dairymen. It shows, however, very distinctly in the difference there is in the producing capacity of farms where stock is kept to consume what is raised on the farm and some purchased feed in addition, and those where all the hay and grain is sold off in the public market.

It is estimated that this manurial value of feeds is more than ample to offset the expense in time and labor of caring for a herd of cows and their product. Therefore, if a man, by keeping cows, can sell his grain to them, and make their product yield him what his grain would sell for in the market, he is doing quite as well as he would not to keep cows. Indeed, he is doing better, for he saves the expense of hauling his grain and hay to market. Whatever his cows pay him over and above the market value for his feeds is so much added profit.

It should not be forgotten, however, that there is no excuse for keeping cows that do not more than pay market prices for the feed they consume. The best four cows in Mr. Gurler's stable enabled him to sell his feed at more than double the current market price for feeds last year when all kinds of feed were so high in price. Mr. Gurler keeps 200 or 300 cows in order to supply the demand for his certified milk in Chicago. In the nature of the case, he has to buy a great many of these cows, and some of them turn out poorly as shown above, but he keeps a record of what each cow produces, and one may be very sure he does not keep a cow the second year that does not promise to pay him well for the feed she consumes. Every dairyman should keep a record with every cow, know just what she is doing, and then he can dispose of the poorer cows and give the better ones a chance to show a better average.

Fall Seeding of Alfalfa.

I have a five-acre piece of land from which I will soon thresh a crop of oats and would like to seed to alfalfa. Would you advise me to sow this fall or wait till spring? If I wait till spring will it be best to sow with or without a nurse crop? How would it be to broadcast field peas now and plow under four inches deep, then plow under next spring and seed to alfalfa? L. D. W.

Greenwood, Ill.

Under ordinary conditions, we do not think it would be safe in Illinois or Wisconsin to attempt to seed alfalfa in August or September, but this season is so much of an exception, the ground is now so thoroughly soaked with water, that possibly the seed would germinate at once and get sufficient growth of root to withstand the winter. However, we should much prefer to follow the suggestion of sowing the field to peas now and turning them under in the spring early and then seeding to alfalfa without a nurse crop.

There is one consideration concerning seeding to alfalfa in Illinois which perhaps should be mentioned, and that is, the absence in many places of the proper alfalfa bacteria and lime in the soil. We have little or no difficulty of that kind in Wisconsin, but the Illinois Experiment Station has warned the people of Illinois several times on these points. However, if our inquirer has been successful with peas and clover, we should not hesitate to try alfalfa, even without inoculating the soil with bacteria and adding lime, although lime and potash are always in order on an alfalfa field.

A Question in Ventilation.

In putting in the ventilators to take out the bad air in a stable could the box or flue be carried up to the ceiling and then carried on a slant to the outside of the building and then to five or six feet above the eaves? Wou.d the draft be all right in this case? D.

Conn.

There would seem to be no reason why a ventilating shaft built as suggested should not prove satisfactory in operation, particularly, if built on the south side of the barn where it will get the benefit of the sun's rays to assist in creating a draft. The ventilating shaft connected with the Senior Editor's barn is entirely outside, in the angle formed by the south and east wings of the stable. So, in the present case, we should prefer to have this shaft all on the outside, doing away with the bend.

Value of Sunflowers for Silage.

Please answer through your columns the value of sunflowers to mix with corn for silage. W.S.K.

Philadelphia. N. Y.

There is no published data upon which to base an estimate of the value of sunflowers for silage. Some years ago, Prof. Robertson in Canada grew a combination of corn, horse beans and sunflower heads for silage, and very acceptable results were reported from feeding this combination. We have heard nothing of it in recent years and the presumption is that it was not found so much superior to simple corn silage as to justify the extra labor. More recently, one of our Ohio readers reported harvesting sunflowers, heads and stalks, and mixing them with corn in his silo. His opinion on this first trial was favorable to the mixture, but whether he has continued to use it or not, we are not advised. Still later, a New York reader tried the same experiment. At the time he wrote us, the silage was keeping well, but he had not fed any of it. We requested him to make a report after feeding and also that he send a sample of it to the New York Experiment Station for analysis, but we have heard nothing further from him. We are, therefore, without any evidence justifying an opinion for or against the use of sunflowers with corn in the silo. If any of our readers can furnish this evidence, they would be doing their brethren as well as the editors a great favor.

Testing Bran for Adulteration.

Kindly state in an issue of the DAIRYMAN the simplest way to test bran for adulteration.

Pittsburg, Pa. Z. H.

Bran is usually tested under the microscope for adulteration. An ordinary magnifying glass would probably suffice

"ADVERTISEMENT."

GOT TO

Have Sharp Brains Nowadays or Drop Back.

The man of to-day, no matter what his calling, needs a sharp brain and to get this he needs food that not only gives muscle and strength but brain and nerve power as well.

A carpenter and builder of Marquette, Mich., who is energetic and wants to advance in his business read an article about food in a religious paper and in speaking of his experience he said: "Up to three years ago I had not been able to study or use my thinking powers to any extent. There was something lacking and I know now that it was due to the fact that my food was not rebuilding my brain.

About this time I began the use of the condensed food Grape-Nuts and the result has been I can think and plan with some success. It has not only rebuilt my brain until it is stronger and surer and more active but my muscles are also harder and more firm where they used to be loose and soft and my stomach is now in perfect condition. I can endure more than twice the amount of fatigue and my night's rest always completely restores me. In other words I am enjoying life and I attribute it to the fact that I have found a perfect food." Name given by Postum Co., Battle Creek, Mich.

THE U. S EXCELS ON ANY TEMPERATURE.

Our "would-be competitors" the DeLaval Separator Co., finding themselves badly beaten in the six weeks' tests of six different makes of Separators at the Kansas Agricultural College, as shown by the official Bulletin No. 123 issued May 26, 1903, in their efforts to break the force of so disastrous a defeat, have compiled a Bulletin of their own "getting up" purporting to be signed by several students, in which they try to make it appear that the DeLaval was not terribly beaten, as the Official Bulletin shows it was as follows:

Average test of skimmilk of DeLaval Separator	**.048**
" " " U. S. "	**.033**
U. S. excels DeLaval	**.015**

Showing that the DeLaval Separator left 45 per cent. more butter fat in the skimmed milk than the United States.

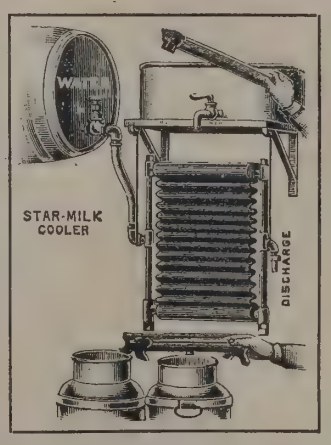
Again in this "gotten up" Bulletin, our "would-be competitors" state that the U. S. Separator "choked up" on 39 lbs. of milk at 70 degrees of temperature and that the DeLaval ran 80 lbs. Every dairyman using a U. S. Separator knows that the U. S. will not "choke up" on 80 lbs. of good milk at 70 degrees, and that such statements are made in an attempt to break the rapidly gaining popularity of the

U. S. SEPARATOR.

We make the following proposition to any dairyman wishing to buy a separator, viz.: We will put a U. S. Separator into his dairy and agree that it will not "choke up" on 80 lbs. or twice 80 lbs. of milk in good condition at 70 degrees, provided he will pay for the separator if it does not "choke up."

The best authorities do not advocate separating at 70 degrees, but if Dairymen prefer to, the U. S. will do it when properly adjusted.

The U. S. Separator skims cleaner than any other separator on the market at any temperature from 70 degrees to 156 degrees at proper adjustment. The Official Bulletin No. 123 of Kansas Agricultural College, dated May 26, 1903, states that



The U. S. Excelled all Others in tests of Skimmed Milk and in Minimum Total Loss.

THE U. S. SEPARATOR HOLDS WORLD'S RECORD.

to detect many of the grosser forms in which bran may be adulterated.

Harvesting and Feeding Mangels.

I have grown a small crop of "Giant Feeding Mangles", or "Half Sugar Beets" for feeding milk cows, in winter.

Please let me know through the DAIRYMAN, best time to harvest, best method of taking care of them till winter, and best way of preserving them in winter. J. M. W.

Bethpage, Tenu.

"Giant Feeding Mangels" and "Half Sugar Beets" are probably fanciful, and to a degree, misleading appellations devised by enterprising (?) seed men to secure trade. Ordinary mangels, given half a chance, will grow to giant size and they always contain more or less saccharine matter.

All the same, mangels make a very acceptable addition to the rations for milch cows. As a general rule, in this climate, they are left in the ground where they grow until the approach of cold weather. They are then harvested, trimmed and stored either in pits, as potatoes are buried, or in cellars. It is not safe to store them in large piles as they give off so much heat that they will soon commence to decay. We should suppose that in the latitude of Tennessee, it would be sufficient to make long, narrow piles and cover more or less thickly with straw,—simply enough to prevent freezing.

Clean Dairy Products.

ED. HOARD'S DAIRYMAN:—I want to record a circumstance coming within my immediate notice lately, to show how great is the need of watchfulness on the part of the consumer to keep dairy products pure and wholesome. We were stopping in a neighboring large village and my wife bought a bottle of cream. It was placed in a dish of water, there being no ice at hand, and left in a west window that was sunny late in the day. The water was not changed at all frequently and yet she tells me that the cream remained sweet from Tuesday till Friday.

Of course there is but one construction to be placed on the case. The cream had been doped heavily, or it would have been sour the next day after it was placed in the window. I do not believe the farmer is guilty of much of this sort of fraud. It is not in his line and he would usually scorn to do anything of the sort, especially when he knew that it injures the quality of milk or cream to put preservatives into it, and the practice has been put under the ban of the law. We must look to the dealer for a thing of this sort. He thinks he needs preservatives, for whenever he gets in a lot of milk in sultry or muggy weather he must stand complaints of sour milk unless he is especially careful or makes use of preservatives. The temptation is great and it is so easy to say that there is no harm in the practice. I have been in the milk trade and I am quite well aware of the way such matters are too often regarded.

New York state, at least, is looking after the milk business pretty closely, considering the circumstances, but it is a task and requires tireless vigilance to keep the trade in line. I am convinced though that the examinations should be exerted for the most part along the line of excluding ordinary dirt quite as much as anything, for that is a very vulnerable side of the business and unless there is some influence exerted all the time from the side of the consumer and the authorities, the tendency towards carelessness is yielded to more than one who has not been in the business would suppose. It is, of course, in winter that the danger is greatest and it is very great unless the greatest care every day is added to good permanent arrangements in the stables, guarding against dirt. It is so easy to get used to anything that obtrudes itself in one's way that we forget to be watchful.

Another and quite different dairy case came under my notice lately. It comes in the line of habit, though, and old-formed associations and ruts that we all get into unless there is someone to shake us out of them. A farmer of the old sort, whose instincts and training had not furnished him with the faculties fine enough to manage a dairy, found himself a few years ago with a dozen or more cows very badly run down. He had run short of feed and appears to have discovered that his cows would actually suffer if no worse, unless something was done. A neighbor with a fine herd and the best of reputation for dairy expertness came across the cows and bought them all.

It was with the buyer an experiment to see what could be done with such a kind of hopeless case. Under the new treatment the cows soon began to gain flesh and most of them were soon giving considerably more milk than they had done. By summer they were all in good condition again, as they had been treated as part of the general herd. It is true that a few of them failed to come up in their milk very much, either being too far gone or not being natural milkers and they had to be weeded out, but the others not only did well, but some of them ranked well up with the best of the older herd, without much regard to breed, some being native.

The herd was kept together some years and then the other end of the experiment was tried. The slip-shod dairyman bought his herd, or what there was left of it, which ought to have been the best of it, back again. I suppose that the reader will say that he had in the meantime been watching the situation and learning where he had failed and where the other management had been better than his. Well, it may be that he did learn some things, but that has not been recorded yet.

I asked the other dairyman how he came out on the second trial and was astonished on being told that the herd was already in just about the same condition that it had been when Farmer No. 2 took hold of it. There was the same lack of feed, system and care as before, and the same lack of profit. So I must say, as I have said often, that it is to the new farmer as a rule that we must look for revolutionizing agriculture and its branches. The new farming is so different from the old, and old ways are held so tenaciously that the change required is too great usually. JOHN CHAMBERLIN.

Erie County, N. Y.

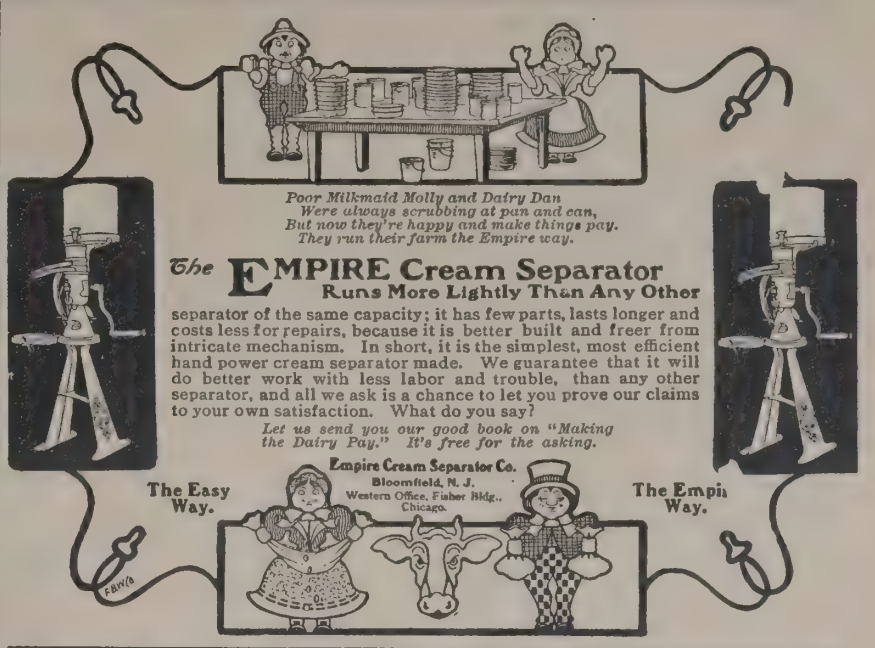
SUBURBANITES.



Breakfast on Coffee, a Roll and a Rush for the Train.

The commuter who bolts down a few mouthfuls of food and hurries to catch the train usually catches dyspepsia as well.

The "coffee and roll" road to ill health is not necessary for there is an easy pleasant way to get back to health and shake off all the coffee diseases by shifting to Postum Food Coffee. "For a number of years I was a business woman rising early and swalling a roll aud a cup of coffee just in time to catch a train. A feeling of nausea or palpitation and a continual dullness in the eyes and head invariably followed my coffee breakfasts until one day a good angel in the guise of a woman friend bade me try Postum Food Coffee in place of coffee.

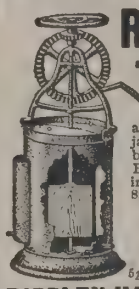
"Always trying to be progressive in my daily life I accepted the advice and the result was I found Postum a delicious clear coffee colored beverage suited to the stomach and satisfying to the appetite. After using Postum faithfully for a month I was surprised at the result in my health. All symptoms of dyspepsia or nervousness had disappeared and because of this marked benefit I reasoned that if such a simple and inexpensive remedy could prove such benefit in my case why was it not my duty to let other sufferers know about Postum. So I began to try to help my friends and I have helped many to shake off sickness by recommending Postum in place of coffee.

There was one who was a victim of nervous dyspepsia and who craved coffee to such an extent that he invariably drank it in spite of medical advice not to do so and I could not persuade him to change, so I got his wife to give him Postum in the morning for a few days without saying anything to him about it. The result was really wonderful. He did not detect the change but noticed that he got over his indigestion. Then we told him the truth about it and now he takes his Postum regularly and is so far relieved of his nervousness that his physician predicts a speedy cure. He likes the Postum just as well as he used to love the coffee." Name given by Postum Co., Battle Creek, Mich.

Did You Ever Keep a Record Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want." We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at following prices:

Price 5c Each	6 for 20c	12 for 30c	25 for 50c



SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

CONCERNING OUR ADVERTISERS.

A Notable Stock Remedy.

If one will but stop to consult his own experience, considering how frequently his own stomach and digestive organs are out of order and in need of some corrective, he will readily see how the same necessities should arise in live stock. It is to meet just this special need of the animal that the popular Prussian Stock Food is prepared and so liberally advertised in our columns. That it is most effective for the purpose, there are legions to testify and none to deny who have given it a fair trial. Some of our readers may be credulous because it is called a Food, and from the fact that the pail in which it is sold for $3.50 contains some 1200 feeds. Its purpose must not be misunderstood. Those who read carefully the advertisements know that its purposes are plainly stated to be to condition stomach and bowels, beget appetite and digestion, assimilation, etc. Whatever accomplishes these things contributes mightily to the well being of the animal, whether it is being kept for work, for milk, for beef or other purpose. In all the advertisements of this preparation, which are over the signature of the manufacturer, the Prussian Stock Food and Remedy Co., St. Paul, Minn., mention is made of a 68 page stock book, which is mailed free, and which plainly sets forth the ends and puoposes of this now popular remedy. The book being free, we assume that the greater portion of our readers being stock owners, are already in possession of it. Such as are not should do so now. It may throw light on many stock troubles heretofore not understood and be of benefit in the future. All the company requires is to write them how many head of stock you have to secure the book.

Thirty-two Weeks Quarantine Off.

Hood Farm, Lowell, Mass., writes that the 32 weeks quarantine in Massachusetts, on account of the foot and mouth disease, is raised. While there was not any trouble at Hood Farm, or in the immediate vicinity, and they are outside the inner quarantine, they felt that on account of their valuable stock, it was wise to take every precaution against the introduction of the disease into their herd. Therefore they felt obliged to stop visitors from going over the farm as heretofore. In many cases it was with great reluctance that permission to inspect the stock was refused, especially when persons come from a distance, and were not familiar with the new rule. The quarantine imposed a great loss upon Hood Farm as during all this time they could not sell and ship stock outside of Massachusetts. They announce that now that the quarantine is off, they will be pleased to welcome visitors, and all will receive the usual courteous attention.

There is a fine opportunity offered a hustling, practical dairyman in the advertisement of J. B. Olinger, Unionville, Mo. On account of age Mr. Olinger feels that he is unable to manage the farm longer and offers it for sale. It is situated four miles from the county seat. It is a nicely improved dairy farm. Investigate if interested. Ad in this issue.

The Drew Elevated Carrier Co., of Waterloo, Wis., have met with unusual success before the dairymen of the country in the past two years with the Drew Carrier. There is no question but what these carriers are a great economy in labor and in fact the modern dairy barn is hardly well equipped without it. This firm have enjoyed an exceptionally nice business from the readers of Hoard's Dairyman and just recently by the increase of their business have been forced into new and much larger quarters.

DAIRY MARKETS.

HIGGANUM, CT., U. S. A.

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY
TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

WORCESTER SALT--IT USES NO OTHER

FOR SALE BY ALL CREAMERY SUPPLY HOUSES.

WORCESTER SALT COMPANY
168 DUANE STREET, NEW YORK.

Weight

Salt that makes weight makes money for the butter maker. DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*," made weight for one creamery at the rate of $8,000 a year in additional profit. The secret is simply this: Whatever weight you add in DIAMOND CRYSTAL SALT, *you obtain in increased weight of butter*. Its pure, dry flakes dissolve completely and become a part of the butter, instead of being washed out, or adhering to the worker rolls, like common, gritty, flinty salt. Our illustrated booklet "Just Salt" is just the thing for dairymen. Free on request.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

"1900" BALL BEARING WASHER
sent free, without advance payment, freight prepaid both ways on 30 days trial. Mr. Geo. N. Burnet, Ashtabula, O., says, "Have done 1200 washings and is good for 1200 more. Beats them all, and have tried 8 different machines." Write at once to "1900" Washer Co., 219A State St., Binghamton, N. Y.

GROOM YOUR CATTLE BY POWER

Our Improved Grooming Brushes, revolving 1200 times a minute, insure glossy coat, clean skin, active pores, health and beauty. Their use increases value of all stock. Indispensable for prize winning show cattle. Will groom 30 to 50 head an hour, and do it better than by hand. Get our Free Booklet and learn to groom your cattle, horses and all stock the best way.

SEARS, ROEBUCK & CO., CHICAGO.

PHILADELPHIA, Pa., Aug. 24—Butter—Market steady. Solids 20c; nearby prints 21c; western 20c.

LITTLE FALLS, N. Y., Aug. 17—Cheese—Sales: 100 boxes large colored at 9¼c; 16 lots (1,456 boxes) small white at 9¼c; 8 lots (425 boxes) do 9¼c; 23 lots (2,058 boxes) small colored at 9¾c; 5 lots (251 boxes) do, at 9½c; 7 lots (508 boxes) do, 9¾c; 14 lots (875 boxes) white Twins at 9¾c; 5 lots (304 boxes) do, at 9½c.

UTICA, N. Y., Aug. 24—Cheese—New Yorkers seemed anxious for cheese today. No change in the price of last week.

WATERTOWN, N. Y., Aug. 22—Cheese—Sales 7,500; 9¾@9⅞c for large ;10@10¼c for small; bulk at 10.

CANTON, N. Y., Aug. 22—Cheese — Offered 2,092 Twin cheese and 1,315 tubs of butter. Cheese sold at 9⅞c; butter at 20c.

NEW YORK MARKET.

NEW YORK, Aug. 22—Butter—Receipts for the week, 58,201 packages.

Exports for the week, 1,060 packages.

Arrivals were heavier than last week, and about 6,000 tubs in excess of the corresponding week one year ago, yet prices for extra creamery were advanced 1c per pound at the close and all grades of table butter were in sympathy. Home trade were only moderate buyers, but speculators were conspicuous in the market, and lots of 50 to 100 tubs were quick taken at 19½c, and fair to good creameries were in demand at 17@19c.

New York State Dairy is in light receipt and fancy tubs are salable at 19c; mixed lots of poor to good sell at 15@17c. A little more doing in ladle butter this week at better prices. Market closes with less animation and speculators show no disposition to fol'ow the advanced prices. We quote:

Creamery, extra, 20c; medium, 18@19¼c; poor, 15@17c; Dairy, extra, 19c; medium, 16@18c; poor, 14@15c.

Cheese—Receipts for the week, 38,362 boxes. Exports, 5,393 boxes.

Prices are a trifle easier and receivers more willing to do business than last week. We note sales of fancy small cheese at 10½@10¾c and large colored goods at 10@10¼c.

Part skimmed cheese sold at 8@9c for very finest, while under grades found buyers at 6@7½c. We quote:

Full Cream, small, extra, 10¼c; medium, 10@10¼c; poor, 7@9¼c. Full cream, large, extra, 10¼c; medium, 9¾@10c; poor, 7@9c.

Eggs—Receipts for the week, 28,137 cases.

There is a scarcity of strictly fancy fresh eggs and prices for this kind of stock are higher. We quote:

New York & Penn., strictly fresh, per dozen, 22@23c; Northern & Western, strictly fresh, 20@21c; all Sections, poor to good, 14@18c.

177 Chambers St. DAVID W. LEWIS & CO.

BALTIMORE MARKET.

BALTIMORE, Md., August 20—Butter—Owing to the very strong windup of last week's market, a very good many were of the opinion that higher prices would prevail this week, but so far their expectations have not been realized. Although the receipts of Creamery Extras are daily growing lighter, there have been but few speculators on the market this week, hence the supply of extras, though light, is about equal the requirements of the consumption trade; firsts have been moving out fairly well, while seconds are neglected entirely. Imitation Creamery—While in moderate supply, has been moving quite slow, as the quality is rather indifferent. Ladles—The kind that are being offered is meeting with slow sale, for the simple fact that the stock is running very irregular, both in body and flavor. Packing stock is in fair receipt, all fresh, sweet lots continue in good demand, while sour is dull sale even at reduced prices. Blocks and Prints—The demand is fully equal to the offerings of all desirable stock. Although at the close of today's business, the market rules steady to firm, on all attractive offerings there is not that activity that characterized last week's market.

Creamery Separator, extras 20@20½c; firsts 18¼@19½c; seconds, 16@18c. Imitation Creamery, extras, 18c; firsts, 17@17¼c; seconds, 14@16c. Iowa & N.W. Ladle, extras, 16½c; firsts, 15@15½c; seconds, 13c; Creamery blocks (2-lb.) extras, 21@22c; firsts, 20c; seconds, 17@18c. Creamery prints (¼ lb) extras, 22@23c; firsts, 21c; seconds, 17@19c. Md. Va., & Penn. Prints, extras, 20@21c; firsts, 19c; seconds, 16@18c.

Eggs—With continued light receipts, especially of desirable stock, and an active demand, the market rules firm at 20c on all desirable offerings.

Cheese—The receipts are ample; demand moderate; market quiet but steady. Swiss—The supply of the new make is quite sufficient for the demand.

N. Y. State—Cheddars, fine, 10¾@11c; choice, 10¼@10½c; fair, 9@9¾c, Flats, fine, 10¾@11c; choice, 10¼@10½c; fair, 9@9½c; Small, fine, 11@11¼c; choice, 10½@10¾c: fair, 9¼@10c; Ohio Flats, fine, 9¾@10c; choice, 9@9¼c; fair, 8¼@8½c; O. Picnic, fine, 10@10¼c; choice, 9¼@9¾c; fair, 8½@9c; Swiss Cheese, (domestic) new, fine, 13@13½c; choice, 11@12c; fair, 9@10c.

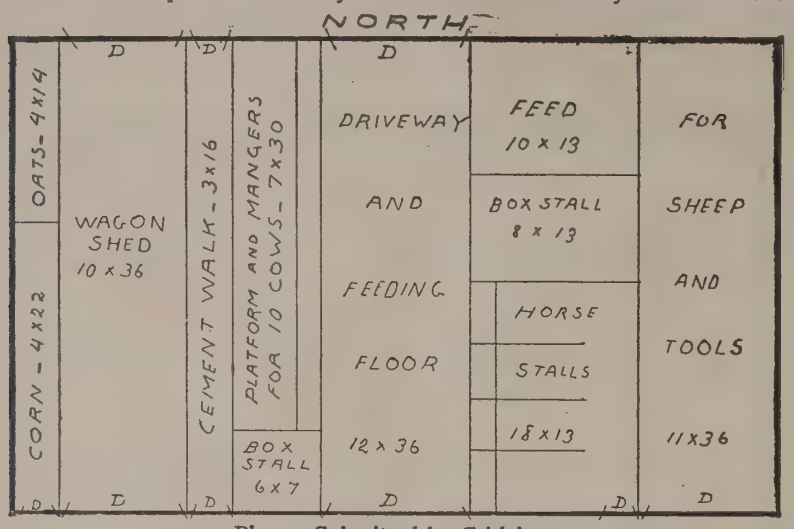
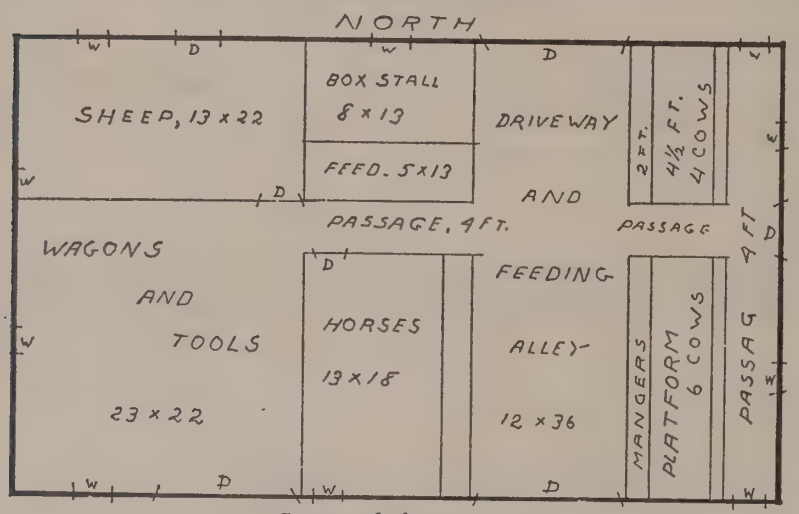
Radisson on the Chippewa—A new town in Sawyer County, Wis., on the North-Western Line, located on both the Chippewa and Couderay rivers, in the center of a most fertile and promising hardwood district. This is an exceptionally promising country for landseekers, while sportsmen will find it an ideal place for camping. The many lakes and streams afford excellent muscallonge, bass and pike fishing, while the woods are full of deer. If looking for a new location, don't fail to see this new country. For map and full particulars write to T. W. Teasdale, General Passenger Agent C. St. P. M. & O. Ry., St. Paul, Minn. 29-3

Home Visitors' Excursion Tickets to Indiana and Ohio—Via the North-Western Line, will be sold at reduced rates on four Tuesdays, Sept. 1, 8, 15 and October 6, limited to return within 30 days from date of sale. For particulars as to territory to which excursion tickets may be sold, etc., apply to agents Chicago & North-Western Ry. 29-sp



Excursion Rates to the Centennial Celebration at Chicago—Via the North-Western Line. Excursion tickets will be sold at reduced rates September 28, 29 and 30, limited to return until October 2, inclusive. For further particulars apply to agents Chicago & North-Western R'y. 29-5

Stable for Cows, Horses and Sheep.



ED. HOARD'S DAIRYMAN:—I intend putting up a barn on 110 acres of land, about ½ being pasture and would like a barn for 10 cows, 3 or 4 horses and 25 or 30 sheep. I will be pleased to have your criticism on plan on opposite side of this paper. Is it all right to use building blocks for foundation? What would such a barn cost in your locality by using the best of pine and covering with slate roof? I appreciate very much the valuable instruction I receive from your paper. A SUBSCRIBER.

Franklin County, Ohio.

It is a much easier proposition to suggest defects in the plan submitted by our correspondent than it is to submit an entirely satisfactory rearrangement of the stable floor in his proposed structure.

Plan as Submitted for Criticism.

Suggested Arrangement.

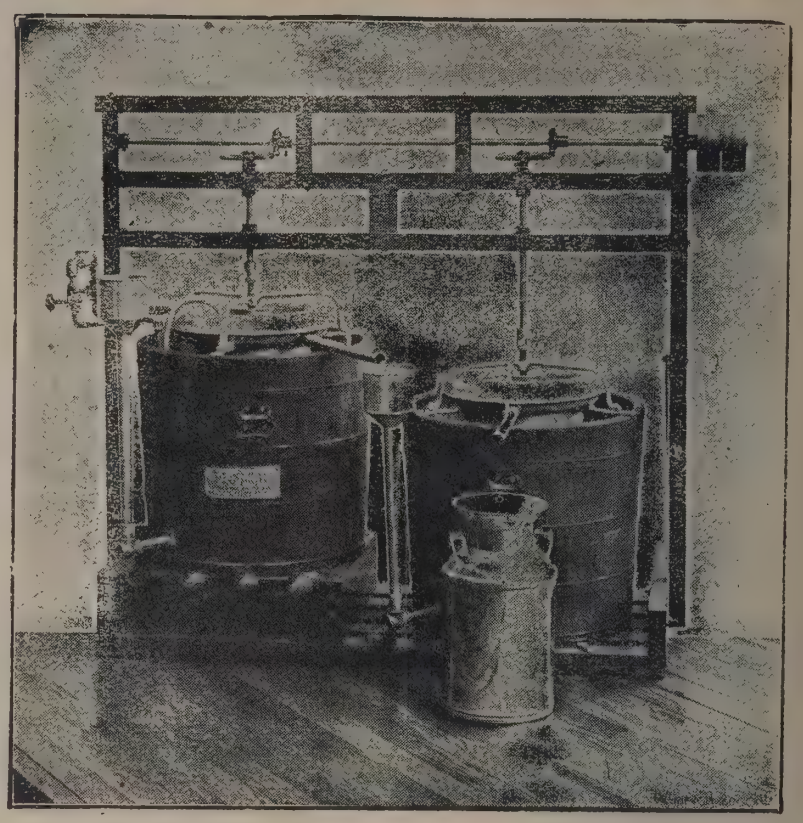
The plan proposed appears to us to be largely objectionable because of the difficulty of getting from one division to another, and especially, that no provision is made for getting into the horse stable or the cow stable from the feeding floor. This objection might be obviated in part, if not entirely, by using one of the horse stalls and the small box stall for cows, as a passage way, but even in that event, the space behind the cows is much too narrow. Four feet for this purpose, besides a gutter at the rear of the cows, is as little as ought to be thought of. Further than this, we suggest that the proposed plan has altogether too many doors and practically no windows.

If we were to subdivide and rearrange this structure for ourselves, without giving any attention to a probable increase in the number of cows, we would use the east end of the barn for the cow stable, making the entrance as shown, and devoting to this purpose not less than twelve feet in width. Next to this would be the driveway and feeding alley, which we have marked on the plan as twelve feet wide, but might better be two feet wider. The passage from this feeding alley between the horse stable and the feed bin is necessary in order to carry hay to the sheep pen. If it were not for this, we would locate the passage ways on the south side. As will be seen from the diagram, we do away with a good many doors and substitute windows.

The widening of the cow stable and the allowance for sides, ends and partitions makes it impossible to provide in this structure for the corn and oats. This is not much to be regretted. The corn crib might better be an entirely separate structure, and the bin for oats could well be placed in the northeast corner on the second floor.

We cannot answer the question as to cost, but would certainly not use wooden blocks of any kind for the foundation.

Meeting of the Eastern Guernsey Breeders' Association.



ED. HOARD'S DAIRYMAN:—The Eastern Guernsey Breeders' Association met at Haddon Farms, the home of Hon. E. T. Gill, Haddonfield, N. J., on Friday, July 24, 1903. The President, Hon. Anthony Higgins of Wilmington, Del., being absent in Europe, the first Vice President, Mr. E. T. Gill, took the chair.

The minutes of the previous meeting were read and adopted, after which the names of the following breeders were proposed for membership: Lucius J. Shepard, Farm School, Pa.; James M. McCamant, New London, Pa.; Penrose Larkin, Lyndell, Pa.; Herbert Warden, Doylestown, Pa.; E. J. Tyson, Floradale, Pa.; Thomas Briggs, Newtown, Pa.; Walter Janncey, Broadaxe, Pa.; B. H. F. Shreve, Philadelphia, Pa,; Joseph Evans, Marlton, N. J.; Ezra Evans, Marlton, N. J.; C. B. Case, Trenton, N. J.; Wm. H. Borden, Swedesboro, N. J.; Wm. I. Tomlinson, Kirkwood, N. J.; R. T. Woodward, Cream Ridge, N. J.; R. T. Ridgway, Cream Ridge, N. J.; John Tyler, Saleno, N. J.; S. H. Gardiner, Ashland, N. J.; P. H. McCormick, Bel Air, Md. The chairman appointed Ezra Michener, E. J. Hollingsworth and E. T. Price a committee on membership.

Ezra Michener, of Michener, Bucks county, Pa., then read a very excellent paper upon, "The Advantages of a Good Bull to the Breeder." He said in part, "A great many breeders do not realize the absolute necessity, if they expect to be successful in their work, of having a good bull to head their herd. A very great many of our best cows and bulls have the blood of imported Sir Champion, 38 back of them.

I think Imp. Alexander 327 was one of the very best bulls ever in this section of the country. He was the sire of Euphe-

BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the **Buhl Factory, "Improved Elgin" and Genuine Iowa Cans**; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

mia 2005, record 15 lbs. of butter in 7 days, Aldine 1211, one of the Chicago cows that stood 12th in rank among the Guernseys at the beginning of the six months' test, and for the last month advanced to 5th position, and made 489 lbs. of butter in the year. Hinda Rose 2089, another daughter, made 12½ lbs. in 7 days and Miss Woodford 2447, 13½ lbs. as a three-year-old, and had she not met with a misfortune would have made Brown Bessie and Merry Maiden think there was a yellow and white ghost after them, and close enough too, to grapple with them at any moment.

Mary Marshall 5604, the winner at the Pan-American, was a granddaughter of this bull as is also Miss Rita 8506, 489 lbs. in a year and No. 39 in the Advanced Register. The bulls that trace to him were equally good and their decendants take very high rank, noticeably, McQueen 1788 who was the sire of Mary Marshall.

The more good cows and good bulls we have back of our breeding, the more sure we are of success. We are getting awake to the fact that we can improve our cattle more quickly by using good bulls, as the bull may give us ten good heifers, while the cow will give us but one.

I think the most practical way to select a good bull is to look up the performances of his ancestors, and if you find that he is backed up by great animals on both sides,—and the more of them the better—pin your faith to him and use him long enough to find out if he is a success, and if he proves worthy, keep him and breed his daughters back to him and thus intensify his good qualities."

When Mr. Michener had finished, the paper was very ably discussed by Prof. Welsh, E. T. Gill, S. I. Murphy, and C. B. Case. The question for discussion: "How shall we treat our cows, that they may make creditable butter records, without impairing the future usefullness?" was opened by Prof. J. P. Welsh. He said: "We should begin with the great, great, grandmother of a cow. Blood will tell. There is a great deal in the rearing of a calf. Calves that should develop into great cows may be so reared that they will come out scrubs. They should be kept growing and healthy, that they may become large cows and develop large udders. A heifer, when she comes in milk, should be fed a good ration as long as she will make milk.

Mary Marshall 5th, record, 9306.3 lbs. of milk and 474.5 lbs. of butter fat as a 3 year-old, never missed a feed and grew all the time she was making her record, and was in better shape for making a record at the end than at the beginning of the year."

E. T. Gill, Dr. M. E. Conard, Dr. Marshall, B. H. F. Shreve, Mrs. E. W. Strawbridge, and Dr. Charles Seltzer spoke upon the question in a very able and instructive manner. The noon hour having arrived, the host announced that lunch was waiting and the meeting adjourned, After all had partaken of the bountiful repast which Mrs. Gill had prepared, the members and their friends proceeded to the barn to view the cattle and the dairy building. The latter is a model of convenience, being fitted up with every improvement necessary to the production of a superior grade of milk.

But the greatest attraction was the noted herd of Guernseys. This is one of the very best herds of the breed in this country, including as it does the famous Glenwood Girl family, which is acknowledged by all to be one of the best, if not indeed the best family of Guernseys in the world. Besides having great butter records, this family has vigor and constitution rarely equaled and not surpassed by any cattle of any breed.

At the head of the herd are Glenwood's Mainstay 6067, and Sir Primrose 5528. Glenwood's Mainstay is a splendid individual and has great breeding. He is by Mainstay 3789, who is a son of the noted Sheet Anchor 2934 and that great cow Rutilla's Daughter 6670, record 637.51 lbs. of butter in a year. His dam is Glenwood Girl 6th 9113, record 667.5 lbs. in a year, the greatest of the family of which she is one.

The calves sired by Glenwood's Mainstay are extremely fine; the heifers show a remarkable development of udder and teats and are large and growthy. Sir Primrose is also a very good bull, he was bred by Geo. C. Hill & Son of Rosendale Wis. His sire Vicount 2117 was by the noted bull Bonny Boy and his dam is Primrose's Tricksey 7236, record 592.16 lbs. in a year.

Mr. Gill is raising a young bull for future use, whom he calls, "Great Combination." He is out of Glenwood Girl 6th 9113 and by Glenwood Boy of Haddon who in turn is out of Glenwood Girl 2nd, record 593.5 lbs. in a year, and by Pat of Haddon 3919, No. 1 Adv. Reg. who was the sire of several great cows. As the afternoon wore away the members and guests departed for their homes. The meeting was full of enthusiasm from beginning to end and all felt that they had enjoyed a pleasant and profitable day. We look forward to another treat in October when the Club will meet with Mr. Edward T. Price at his farm at Broadaxe, Pa.

Landenberg, Pa.

Hand Separator Cream.

ED. HOARD'S DAIRYMAN:—The pessimistic views held by some of our creamerymen regarding the effect of the hand separator system as regards quality of the product because the controling (?) factor as to the quality being taken away from the buttermaker, I would beg to state, having had considerable experience with the hand separator, that while the quality of cream, same as we find in quality of milk delivered, is liable to be below the standard that it should be, the butter maker has it however, at his own discretion to put the responsibility where it belongs.

In the first place, every thing being equal, the farmer can take better care of a small quantity of cream than ten times that amount of milk, to say nothing about the purification which takes place during separation, thereby enhancing keeping quality; especially so if the separating is done before the animal heat has disappeared, thereby averting all danger of taking up any bad odors that will be taken up when the temperature is even, or below the surrounding atmosphere. As it is generally known, milk does not take up odors until it reaches the temperature, or below, of its surroundings.

When, as above stated, the responsibility is placed where it belongs, the quality of cream will be equal, or better than the quality of milk as now delivered.

HOW TO DO IT.

Grade the cream, and pay according to quality delivered. With the acid test there cannot be much trouble to show the farmer the condition of his cream, same as he can be shown in a few minutes by the Babcock test, the value of his milk. When it involves the all sensitive spot, the pocket, the majority will see to it that carelessness on their part is brought to a minimum.

I was in a creamery today where several thousand pounds of butter are made every day, wholly from hand separator cream, some of it being shipped nearly two hundred miles, and found as good quality as I have ever seen at this season of the year in a whole milk creamery.

The pleas for the whole milk system are so insignificant, and the advantages for the hand separator system so great, that one might as well try to stop the tide of the ocean as to try to stop what Nebraska and Kansas have learned to be of the greatest advantage to all concerned—the hand separator system.

Lincoln, Neb. J. FRED SCHLAPPI.

GOOD INTENTIONS ALONE CANNOT PRODUCE GOOD MACHINERY. Most all manufacturers are honest, but lack the experience and equipment necessary to turn out a thoroughly first class engine. We are the founders of the Gas Engine industry in the United States; have been building **OTTO** engines for 27 years, and operate the largest and most complete plant in the country devoted exclusively to the building of Gas and Gasoline Engines. With the Georgia Dairymen.

ED. HOARD'S DAIRYMAN:— The Georgia Horticultural Society, the Ga. Agricultural Society and the Ga. Dairymen's Association, met in Athens, Aug. 3rd. to 7th inclusive. A small but enthusiastic audience, responded to President Williamson's call to order, on the afternoon of the 4th. The President's address was a very able paper. He said in part, that it was a fact worthy of congratulation, that the Georgia Dairymen's Association, had survived for nine years. He spoke of the necessity of farming with live stock in the South, and believed dairying had advantages over other live stock raising. He quoted statistics to show why so many young men were leaving the farms, and declared that farm laborers were the poorest paid of any laborers in the United States, and he could not blame the young men for leaving the farm, neither did he consider it so detrimental to the farm interests in general and said, "If more cultured people would leave the farms and go to the cities, it would lessen competition in an over-crowded calling, raise the price of farm products and increase farm wages.

He also condemned the policy of wealthy men who buy farms, and compete wtth the farmer who is farming his own land. President Williamson is a man who makes no statement without careful consideration, and his statements, some of them though, somewhat pessimistic and opposed to the arguments of many agriculturists, are worthy of careful thought.

Mr. G. W. Holmes, of Madison, read a paper on "Practical Dairying," which he interpreted to mean, profitable dairying. "The first essential is a good cow, then good barns that are light, and in winter warm and well ventilated, and in summer cool, with two rows of cows facing each other, platform sloping, and all arranged for the comfort and cleanliness of the cows; bedding with a light sprinkling of chaff.

Something for the cows can be planted every month in the year, and the cows do better, "he believes in a change of food, feeds as much green food as possible, and changes it every few days, if convenient." In the discussion that followed, Mr. Holmes advised sowing turnips for fall and winter, also vetches with oats, wheat, barley or rye. He considers vetches to be more liable to stand the winter than the grain; never has failed getting a crop; sows about 3 pounds to the acre, with the afore-mentioned grains.

Some one inquired about rape, and some one in the audience, had raised it successfully. Prof. Henry of Wisconsin, spoke of its value as a forage crop and advised the farmers of Georgia to raise it.

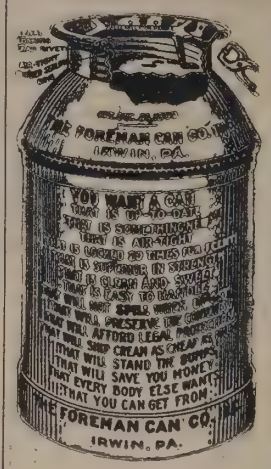
Prof. Johnson of the State Agricultural College, at Athens, spoke on the subject of "Forage Crops," he was followed by Prof. Newmans of Clemson College. The two speakers strongly advised the farmers to raise a greater variety of forage crops, that may be raised in this section. Prof. Johnson reiterated the statement of Mr. Holmes that something may be grown every month in the year, but advised the farmers to plant more corn and make ensilage; he invited the dairymen to visit the College grounds where there were small plots of soy beans, cow peas and sorghum, sown together. This latter was recommended, though it seems to the writer to be unsatisfactory, as they do not mature together, however, this may not be a serious objection; velvet beans also were making a good growth.

Prof. Newman advised the raising of hay of all kinds except crab grass. He said that impoverished the soil too much. He spoke highly of alfalfa and told of fields that he knew of, that were over 25 years old and still yielding several tons in a season. He said in the south it is better to sow the seed in drills in the fall and cultivate it. He advised raising the clovers for hay, and told of the crop that was raised in DeKalb Co. on a single acre, and a single cutting for which the owner refused $90 in the field.

Prof. Henry inquired as to the price of hay in the markets and the prospects for raising it. Considerable discussion followed and the concensus of opinion seemed to be that if from one to four tons of hay could be raised per acre, worth $20 per ton, on land that can be bought for from $10 to $40 per acre, that there ought to be money in farming, and that it would be to the financial advantage of southern farmers to quit raising cotton and raise hay.

Prof. Newman spoke of the advantages of hog raising in the south, the great variety of forage crops and root crops that may be raised here. In addition to the forage crops that have been mentioned for cattle, and which are equally as good for the pig, may be mentioned, Spanish peanuts, sweet potatoes and turnips. These forage crops may be gathered by the hogs by building a portable fence of woven wire. This may be made by fastening the wire to small oak posts, then rolling wire and posts up together. It can easily be transported, post holes driven and the fence set up quickly.

Dr. Jago, of Athens, read an instructive paper on Milk Fever. He advised the Schmidt treatment and gave details. Dr. Jago laid special emphasis on the injunction to farmers not to give medicine to the cows after the disease has progressed far enough to cause paralysis of the throat, as the medicine then goes to the lungs and causes pneumonia.



The Secretary read a paper by B W. Hunt, of Eatonton, on "The Importance of Adding Phosphate to the Cattle Rations of the South." Mr. Hunt has found in his practical dairy work that young cattle and colts do much better on clay soil if phosphate of lime is added in small quantities to their daily rations. It is his belief that there is a lack of lime in the soil which should be supplied. He also feeds it to animals before they drop their young.

At the evening session, Prof. W. A. Henry of Wisconsin, spoke on The Development of Agricultural Education in the Northern United States. The summer school for teachers is now in session at Athens, and many of the teachers were present, and Porf. Henry directed a part of his address to them. He told how the great Agricultural Colleges of Wisconsin, Minnesota, Illinois and other states had grown from small beginnings to their present size and power. He told how, until the short course in dairying and in agriculture was established, they made almost no progress; now it is possible for a young farmer to attend a winter school without interfering with his farm work. Two winters completes the short course.

The graduates of these short courses are in good demand at remunerative salaries, thus offering a congenial occupation in a line of work where there is little competition and endless opportunities for accomplishing more in the world's progress than in the overcrowded professions. Many of the students go back to the farms; some of them run in debt for land, improve it and pay for it. The prosperity of the country has greatly increased, and from a county, which a few years ago was growing poor, raising wheat, it has become, by raising live stock, a diversification of crops, and the application of brains to farm methods, one of the most prosperous sections of the country. Land has grown high, and consequently taxable property has increased. Prof. Henry urged the south as a business proposition to make appropriation for its agricultural colleges and schools. The Governor of Wisconsin has made the statement that for every dollar the state has spent to further agricultural education it has received back ten.

Wednesday morning, Prof. Henry again

THE BROWN BESSIE HERD Offers one bull 14 months old, sired by Recorder, 29239, the only living son of Brown Bessie and has 14 tested daughters. Dam, Relay, 70353, test 17 pounds 2 ounces. She a daughter of Diploma with 61 tested daughters. Also Berkshire Pigs of English and American selected stock.

(258 lbs. milk) in 1 wk; died of milk fever this (3d) calf. Thrifty, solid color.
E. E. STEVENS, North Madison, Ohio.

THE BREAK DOWN
is usually in the wheel. They receive the strain and wear. They dry out, spokes and felloes rot, tires come loose. Get the service out of wheels you do out of gears by using
Electric Metal Wheels.

You have a wagon for a life time. Electrics are the staunchest, tightest, easiest running wheels made. Straight or staggered oval steel spokes, cast in the hub, hot riveted in tire. Broad tires, no rutting, light draft, any height, fit any wagon.
Write for free illustrated catalogue on Electric Wheels and Handy Wagons.
ELECTRIC WHEEL CO., Box 130, Quincy, Ills.

SAVE PAINT BILLS Instead of using Metal Roofing, which requires painting every two years, use Arrow Brand Asphalt Ready Roofing already surfaced with gravel, and which needs no painting.

ASPHALT READY ROOFING CO., 82 Pine Street, New York. Send for free samples.

spoke, his subject being; "The Rational Feeding of Dairy Cattle." He first briefly outlined the basic principles of feeding animals, then urged the farmers to grow all the home grown feeds possible, and supplement them with cotton seed meal; showing how it was possible to feed meal to cows and have three-fourths of its value left in the fertilizer.

Considerable discussion took place in regard to the amount of meal that it is safe to feed a cow, some considering more than three or four pounds per day dangerous, others feedng more, with no apparent injury; some believed it to be a very dangerous feed for calves; others had never seen any ill effects from it. Col. Redding, Director of the Experiment Station, spoke briefly of The Relation of the Experiment Station to Dairying. Col. Wade read a paper on The Model Dairy Cow.

Prof. Willoughby, dairyman at the station, read a paper on Cheapening the Cost of Milk and Butter. Prof. Willoughby urged the necessity of reducing the cost of production without impairing the product. The old officers were re-elected: president, W. D. Williamson, Harmony Grove; sec., M. L. Duggan, Sparta; treas., T. W. McCallister, Lavinia. The meeting adjourned to meet next year at Tallulah Falls. M. E. BEMIS.

Scottdale, Ga.

Silage vs. Corn Fodder.

ED. HOARD'S DAIRYMAN:—Will the fellows who contend that we get no more out of our silos than we put in them, explain why the steers at the Kansas Experiment Station sold for 25 cents more per hundred than did the steers in the same experiment that got only dry feeds, and why Armour Co., in the slaughter test, reported that the silage steers had just the right amount of fat well placed and were fine enough to sell in any class of dressed beef, while the dry fed steers dressed out deficient in fat poorly placed? And why the ensilage fed steers gained 100 lbs. for 715 lbs. of grain consumed, while the dry fed steers required 733 lbs. of grain per 100 lbs. gain, a saving of 18 lbs. of grain per cwt. in favor of the ensilage fed cattle? This saving of grain plus the 25 cents per cwt. in the selling price in favor of the ensilage fed cattle, we are told by Prof. Otis made a saving of 52.62 cents per hundred pounds of gain. He then makes an estimate of the value of an acre of corn that will yield ten tons of ensilage per acre and finds that it is worth $32.90 if fed as per above.

Have we any records showing such results from such a corn crop handled in any other way? If so, I would like to know of it.

Now what did the Kansas Station put in their silo? Just ten tons of green corn that would have husked out 40 bushels of grain if allowed to ripen. This grain would sell in Manhattan for 30 cents per bushel or $12 per acre, leaving a value of $20 to be accounted for in the stalks. Now the cured stalks would weigh two tons and are worth, say, $5 per ton, or $10 for the acre, so what about the $10.90 yet to be accounted for? Did or did not the silo add something to what was put in?

Every dairyman that has silos knows full well he gets a good deal more out of his cows per acre of corn crop fed, than he ever did from his corn fodder, so he can credit the gain to the silo or cows, just as he pleases. I prefer to give the silo the credit.

Some days ago our herdsman turned the Jerseys on the rape patch after milking them at night, allowing them to remain there for about one and one-half hours each time. The result is that we are now getting a gain of 40 lbs. of milk daily and the gain not yet stopped. These cows are in two good pastures of white clover day and night, but the change of feed pleases them very much.

The rape pasture we are using for our Berkshire hogs covers less than three acres, but with nearly 100 hogs and pigs on it it shows no lack of feed. Our pigs ninety days old weigh 91 lbs. and 95 lbs. each, while the sows are in good flesh.

Last week I went over in Iowa and took some pictures of some Buff Jersey silos. At one place, where a one-hundred-ton silo was put up last fall, I was told that another one would be put up at once. This man was induced to build a silo greatly against his will. He did not believe they were of any particular advantage, but now he is one of the strongest advocates of them that I know of.

Monmouth, Ill. BUFF JERSEY.

Improving the Dairy Herd.

ED. HOARD'S DAIRYMAN:—The improvement of the dairy herd depends in a great measure upon the sire. The cow may be posessed of the highest points of excellence, but her good qualities will not be sufficient unless mated properly, to transmit to her progeny. A cow may be easily tested, by the Babcock machine, and also by her milking capacity and be discarded if these are not satisfactory, but no such test can be applied to the sire. He must be tested first, by his ancestry; second, by his offspring; and third, by his form.

The sire, if intended to build up and improve the dairy herd, should come, first of all from a dam posessing fine milking capacity and one that was also a good breeder—that is, she should have been one that transmitted her good qualities in a marked degree—and if the sire to whom she was bred had good ancestry, also, then with such ancestry there is a reasonable hope that the offspring from such a sire will be all that is desired. Third, his dairy characteristics, or form should conform somewhat to the general outline or type of dairy sire, although these points are not to be wholly relied upon. The skin of the sire should be fine, soft and rich colored; good width of hips, depth of hind part, deep ribs, large chest capacity are the principal points.

Having such a sire possessing all requisites as far as known for good breeding, the supreme test is to watch the development of the calves into the milking stage. If the females of his get develop into or possess the virtues of the ancestry—then it will be safe to retain him as leader, but not otherwise. An inferior sire will undo the work of generations of improvement in the dairy herd; discard him.

PRACTICAL.

GEO. WENHAM, Fort Atkinson, Wis.

Keeping up the Milk Flow in August.

ED. HOARD'S DAIRYMAN:—Keeping up the milk flow in August is pretty difficult. With heat, dry pastures and, last, but by no means least, flies. The first week of August with me was very hot and dry, and we were put to our trumps to keep the milk up to a respectable showing. The complaint was general among our neighbors that the milk was reducing terribly, and they suffered much more than did we. Our loss of milk during the first week of August was 31 pounds off the preceding week, 66 pounds from the week before and 81 pounds less than the maximum weekly yield of the year, which is not a bad showing at all for the first week of August. August is supposed to be one of the worst milk months in the year. The pastures which were green in June and well into July, are in August, seared and yellow, devoid of nutriment and distasteful to the cows. Unless one has plenty of pasture, of various topography, it is useless to depend upon pasture in August. Green crops and a big feed of meal is the only dependence for August milk.

Cows which have not been receiving daily meal rations are the ones that show the greatest falling off in August. It is not the feed of oats that Cresceus gets on the morning of the race that supports him in the contest against the seconds on the race day. It is the culmination of good care and feeding for months back that gives the great horse the power to hold up his phenomenal speed. It is the same with the milk flow of a good milk cow (a great milk cow has usually as much potential nervous energy as a Creceus.) It is not altogether the feed she gets today that sustains her in the milk-flow of today. It is the cumulative strength of previous months, laid by to be drawn on as needed, that sustains the well cared for milk cow in times of heat, drought, short pastures and flies.

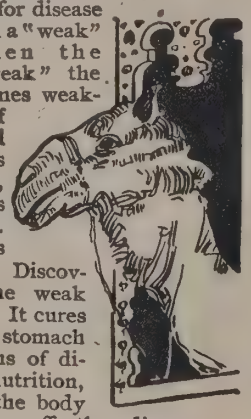
Here then comes the necessity of preparing for war in times of peace. Along in June, when pastures are good and the milk flow satisfactory, the dairyman thinks it needless expenditure to feed meal. He may feed meal at this time, and find that the milk flow is not very much increased, and he therefore decides that it does not pay to feed costly meal at this time. Meantime the cow, if a good one, is giving unselfishly, every pound of nutriment she so industriously gathers, and more, into the milk-pail, retaining nothing for the strength and support of her own body, or to fortify herself against a time of drought and flies. When this time comes, the cow is unable to withstand the untoward conditions.

It is now too late to make up by feeding meal however heavily, for extra feeding all at once, will not bring up the milk flow. This is the reason that the milk flow at the cheese and butter factories, falls so low in August. As a general thing three-fourths of the patrons feed no grain or meal to their cows during the early summer, and it is only when they see the milk reducing every day, that they will begin at all to feed grain, and then it is too late.

Green, slushy food, as peas and oats, corn, etc., is a poor substitute for grain, to restore the cow's vitality and sustain her through the trying month of August. It will not do it. Green food of some kind is of course necessary and indispensable, but it should not be depended on entirely. It should only be fed in conjunction with a good meal ration. We believe ground oats one of the best summer feeds, if it can be obtained at a reasonable figure. This is what I have been feeding myself, this summer. I was able to get ground oats, delivered at my railway station, for $20.00 per ton. Bran I could not get for less than $24.50 delivered at my station, so feeding bran this summer is pretty dear feed, and almost prohibitive. I am able however, to get cracked corn, slightly damaged, delivered for $20.00 per ton also, and this mixed with ground oats, makes a tip top feed for any animal.

It is only by watching the markets however, that I am able to get those snaps in feed. Most dairymen do not do this. Many of them hardly take a daily paper, and they know nothing of those bargains in feeds. Of course it is hardly to be wondered at that our factory patrons do not feed much, if any mill feed to their cows. With bran at almost $25 and other feeds in proportion, one requires to have great faith in his cows, and also in the virtue of good feed, to invest at those prices. At one time I argued that the milk flow could be kept up on nothing but green food stuffs alone, in conjunction with pasture, and without the use of any meal at all. I know better now, that this cannot be done.

If cows are expected to keep their flow of milk, the feeding of ground feed is imperative. To some of our cows we are feeding these days, ten pounds of oats and corn per day. We have fed scarcely any green food as yet. We have pasture at various stages of growth, which answers so far. During the hot days of this week, we had our cows for a part of the day in the wood pasture, where no animal has taken a bite of it this summer. The cows appreciated the shade as well as the white clover and soft grasses in the shade of the trees and brush, and by the use of a liberal sprinkling of kerosene, we managed to stay, to some extent, the ravages of the flies.



We find a great difference in the effect the flies have on different cows. Some of our cows the flies appear to have little affect upon, while others seem to be pestered to death by them. The strongest and most robust cows are the least affected, while the older and weaker, and those of more delicate constitution, appear greatly affected. The fly appeared to have no perceptible affect on a few of our cows, that is in the milk flow, while others if not protected from the fly in some way, would appear to dry up entirely. An application of kerosene spray each morning appears to arrest the ravages of the pest, and makes the cow fairly immune.

Only two of our cows seem to be helped by the application of fly repellent. The other more vigorous and thick skinned cows do not appear to give any more milk because of a spray of repellent in the morning. Those two cows, however, did they not get an application of repellent, would diminish greatly in their milk.

In a word, then, we have been able to keep the milk flow up to a respectable average only by much care and attention—by the cumulative affects of meal feeding all summer, and by increasing the daily meal ration since the month came in; by changing pastures to suit the atmospheric conditions, weather, etc.; watching closely that the cows get a fill under any and every circumstance, and

THE CAMEL'S HEAD.

"Where the camel's head goes his body follows," says an Oriental proverb. It's the same way with disease. A small opening will give it an entrance and when disease once has a place in the body a large number of ills may follow it.

The opening for disease is often found in a "weak" stomach. When the stomach is "weak" the body also becomes weakened by lack of nutrition, and disease attacks the heart, liver, lungs, kidneys and other organs.

Dr. Pierce's Golden Medical Discovery makes the weak stomach strong. It cures diseases of the stomach and other organs of digestion and nutrition, and so enables the body to resist or throw off other diseases.

Men and women who are sick are invited to consult Dr. Pierce, by letter, *free*, and so obtain without charge the opinion of a specialist on their ailments. All correspondence strictly confidential. Address Dr. R. V. Pierce, Buffalo, N. Y.

"For the past two years I have been a very sick woman," writes Mrs. Chesley, of 108 Woodland Ave., Cleveland, Ohio. "I tried medicines from doctors and to no avail. At last I decided to try Dr. Pierce's Golden Medical Discovery. When I started I was all run-down and had a very unpleasant taste in my mouth. Was choked up, and at times it was very hard for me to breathe. I had severe headaches and cutting pains in my knee joint. Was so weak I could not attend to my work nor walk up or down stairs without the assistance of my brother or some friend. I am now taking the fourth bottle, and am happy to say I feel like myself again. I can go up and down stairs and perform my duties as well as any one. Everything seems to be brighter, and I can assure you that life is worth living."

Accept no substitute for "Golden Medical Discovery." There is nothing just as good for dyspepsia or debility.

Biliousness is cured by the use of Dr. Pierce's Pleasant Pellets.

The New 1903

REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

A. H. REID, 30th and Market Sts., Philadelphia, Pa.

THE

Iowa Dairy Separator.

AN UP-TO-DATE MACHINE REPLETE WITH PRACTICAL IDEAS

It is built in the following sizes:

250, 350, 450, 600, 750 POUNDS PER HOUR

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

that they get a fill also of water twice a day at least.

Before a maximum amount of milk can be expected the cows must fill themselves with feed of some kind. That should be patent to every one. We cannot make bricks without straw. A cow giving 25 pounds milk daily, needs to eat 75 pounds pasture grass or its equivalent. If the cow is only able to secure during the hot dry month of August, but 50 pounds grass or its equivalent, no one should be surprised if that cow gives but 15 pounds of milk a day. That's all she can get out of 50 pounds grass anyway, and if she gives more milk than this, she must draw on her own body, which is a costly piece of business coming on winter. Seventy-five pounds of August pasture grass will not produce 25 pounds of milk though, because the nutriment, is not in the August grass. If 75 pounds of June grass are required to produce 25 lbs. 4 per cent milk, it will take fully 85 to 90 pounds of August grass to do the same thing, and we doubt if any common cow can assimilate that much dryish grass, hence the necessity of supplementary food, if the milk flow is to be kept up.

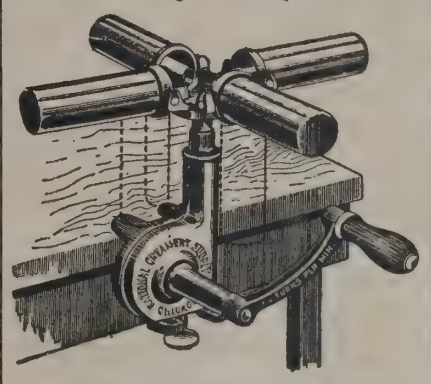
Handling Manure.



ED. HOARD'S DAIRYMAN:—In my letter of some weeks ago I did not mean to be understood that I thought manure was any better for lying in the cellar through the winter, but it was better to be there than on the ground where you are to raise crops the next year. That has been our experience and with these methods practiced we have nearly doubled our hay crop in the past four years. We must have cut two tons of hay per acre this season.

Do you, Mr. Editor, draw out your manure every day, rain or shine, Sundays and holidays. If not what do you do with it on these days and how do you save all your liquid manure.

Williamstown, Vt. R. G. DAVIS.

There are very few days in the year when the manure is not drawn from our stables and spread upon the ground. When it is too inconvenient to do this the accumulation of a day or few days may be piled in the yard and hauled away as opportunity offers. The liquid is gathered with the solid and hauled away in tight boxes.

NATIONAL
Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

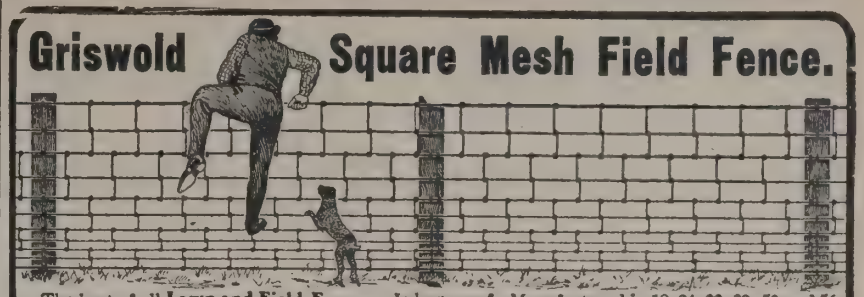
Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitable than an unprofitable cow.

NET PRICES:



No. 1,—2 bottle, complete for testing milk.... each $4 00
No. 2,—4 bottle, complete for testing milk.... each 5 00
No. 3,—2 bottle, complete for testing cream and milk, each..... 4 50
No. 4,—4 bottle, complete for testing cream and milk, each..... 5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, dipette and test bottles.

Most Profitable Disposition of Milk.

ED. HOARD'S DAIRYMAN:—Would like a little information on skim milk *vs.* condensor.

A. lives twelve miles from a condensor and is not a No. 1 butter maker, but is willing to learn and accept information from those that do know how. B. lives four miles further from condensor and claims he can make more by shipping to condensor and it costs him 15 cents per hundred to get his milk delivered, while it costs A. 12 cents.

A. has a good market 12 miles distant for all the good butter he can make. Now if A. works his raw product up at home and has all of the by-product to use, is A. ahead or not? UMPQUA.

Auburn, Wash.

We should think it would be far more profitable for A. to make up his milk at home, and thus save the greater part of the 12 cents per hundred pounds for transportation, and have, in addition, the skim milk for feeding purposes.

Causes of Tainted Milk.

The Swiss scientist, Dr. Gerber, gives the following causes of bad or tainted milk:

1. Poor, decayed fodders, or irrational methods of feeding.
2. Poor, dirty water used for drinking water or for the washing of utensils.
3. Foul air in cow stable, or the cows lying in their own dung.
4. Lack of cleanliness in milking; manure particles on udder.
5. Keeping the milk long in too warm, poorly ventilated and dirty places.
6. Neglecting to cool the milk rapidly, directly after milking,
7. Lack of cleanliness in the care of the milk, from which cause the greater number of milk taints arise.
8. Poor transportation facilities.
9. Sick cows, udder diseases, etc.
10. Cows being in heat.
11. Mixing fresh and old milk in the same can.
12. Rusty tin pails and tin cans.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Twin Calves.

One of my Guernsey cows has just given birth to twin bull calves. I am told they will be worthless as breeders. Is that true or only a theory? This cow did not clean out and I had the afterbirth taken out 48 hours afterwards. Was that the proper thing to do?

We cannot get one of our cows to eat as she should. The veterinarian who examined her said she ought to have a tonic, but I don't like to give it to her. It does not seem natural to drug an animal. A SUBSCRIBER.

Milwaukee, Wis.

ANSWER.

No. 1. There is no reason why the bulls should be worthless as breeders if they are otherwise in good health. The theory that they will not breed, is without foundation, but where the calves are of opposite sex the heifer is seldom a breeder.

No. 2. We are of the opinion that a good tonic would be indicated in your case.

Mange.

We have some cattle that have mange or barn itch; will Cooper's dipping powder injure the cattle, as it is the only dip handled in our town? G. W. P.

New Sharon, Ia.

ANSWER.

Any of the coal tar preparations, will cure mange.

The writer uses zenoleum, but is not familiar with the action of Cooper's dipping powder.

Barreness.

What can I do for a cow that will not breed on account of the closing of the mouth of the womb?

Ferndale, Cal. C. C.D.

ANSWER.

If the womb is closed by an abnormal growth, it must be removed surgically, but this is not always the case when a cow is barren. The neck of the womb is naturally so constructed as to make it

"ADVERTISEMENT"

SCOURS IN CALVES.

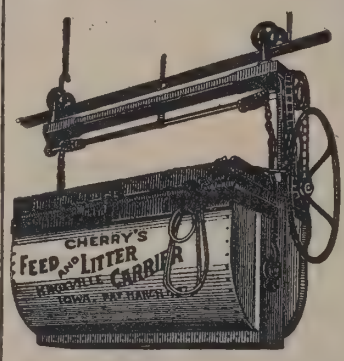
SCOURS in calves can usually be traced to improper food or to improper feeding. The natural food of the young calf is liquid, and when solid substances are suddenly substituted derangement of the bowels is apt to follow which will result in diarrhœa. Hence the necessity of changing food from liquid to solid substances gradually.

Water in which hay has been steeped, and bran, middlings, and flaxseed meal added, forms a good substitute, as it is easily digested and very nutritious. Separated milk is almost wholly deprived of the fat, and a little flaxseed meal should be added to replace that taken from whole milk.

Milk that is allowed to stand for awhile not only forms acid, but also numerous cryptogamic growths such as mould, which are extremely poisonous and deleterious to the digestive mucous membranes, and is almost sure to result in scours.

Treatment.—The remedy in such cases is to avoid as far as possible irritating substances. It is much better to give milk in smaller quantities and more frequently. Milk that is excessively sour should be carefully avoided, or given in small amounts frequently.

Milk tanks should be thoroughly cleansed with scalding water and some alkali, such as bicarbonate of soda. As a remedy for scours, prepared chalk, 2 ounces; powdered ginger, 2 ounces; powdered opium, 2 drams, and peppermint water enough to make a pint, given in from one to two tablespoonful doses two, three or four times a day, gives excellent results. Before the administration of astringents, such as the above, it is often of great value to give a dose of caster oil, olive oil or raw flaxseed oil, from two to four ounces, to remove irritating substances from the digestive tract.



Give tonic doses of Dr. Hess Stock Food, the great calf tonic, formulated by Dr. Hess (M. D., D. V. S.), used by prominent veterinarians and endorsed by famous colleges.

No unprofessional manufacturer can equal it. 100 pounds, $5.00 (except in Canada and Pacific Slope); smaller quantities at a slight advance; fed in small dose; sold on written guaranty. For every disease and condition for which Dr. Hess Stock Food is not recommended, a little yellow card in every package entitles you to a letter of advice and a special prescription from Dr. Hess free of charge.

Dr. Hess has written a book on the diseases of stock and poultry—the only complete treatise for farmers and stockmen. Consulted and commended by leading veterinarians.

Write and state what stock you have—and how many head of each, what stock food you have fed, also mention this paper. Address Dr. Hess & Clark, Ashland, Ohio, and you will receive one of these valuable books free, postage paid.

Cherry's Perfected Barn Equipments.

JAMES C. SMITH,
WAUKEGAN, LAKE COUNTY, ILLINOIS

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The

DREW ELEVATED CARRIER

will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating—it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.

It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

"WATCH IT WORK FOR YOU"

WRITE FOR OUR ILLUSTRATED CATALOGUE, FULLY EXPLAINING ALL ABOUT IT.

Also receive testimonials from hundreds of farmers and dairymen who have the Drew Carrier on their farms

WILCOX & HARVEY MFG. CO.,
186 Lake St., Chicago, Ills.

appear entirely closed to the layman. This may be the case with your cow. A change in bulls often is sufficient. If the animal is fat, her flesh should be reduced to a normal condition. Plenty of exercise is needed.

Stricture in Teat.

I have a young cow with first calf. The calf is three weeks old, and ever since calving her two front teats refuse to pass the milk without putting a tube up in them, until about a week ago, when one got all right; but the left one is as bad now as at first. After we pull the tube out there seems to be no lumps in the teat, the trouble seems to lie about ½ inch from point of teat. GEO. W. I.
La Grange, Ky.

ANSWER.

The cow has a stricture in the teat which prevents the milk from coming down. Your remedy is the teat bistoury which will give immediate relief.

Lump Jaw.

I have a fine grade Holstein yearling heifer that had a bunch come on her jaw about six weeks ago. It is hard now and almost as large as a quart bowl. J. D. V. R.
Oxford, New York.

ANSWER

The lump may be dissected out if it is not attached to the bone. Some dairy men have destroyed them by opening the lump freely and injecting into the cavity within tincture of iodine full strength.

To Hurry the Period of Oestrum.

I wish to ask you what to feed a cow so as to hurry the rut or heat. I have been told rye.
Ackerville, Wis. A. L.

ANSWER.

Any of the grains rich in protein will hasten the period of oestrum if fed moderately so as not to overload the digestive organs. If you wish to feed rye, it is well to add wheat bran to the ration so that the food will not lie too solid in the stomach.

Abscess.

I have a two year-old heifer that has two swellings on the left hind leg at hock joint, one about 2 inches above the other First noticed, about one week or 10 days ago; one swelling has broken and discharged some pus, other not broken yet; size about that of an egg. SUBSCRIBER.
Toulon, Ill.

ANSWER.

The enlargements appear to be abcesses which are not dangerous. They may be opened and the pus squeezed out and the cavity syringed with tincture of iodine. After this, wash clean with soap and water daily and apply an antiseptic dressing.

Ringbone.

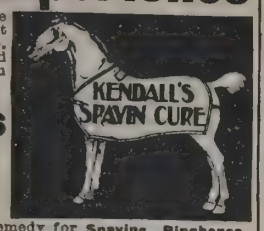
What will cure a ringbone? M. C. A.
LaMoure, N. D.

ANSWER.

The most reliable remedy is to have it properly fired. Employ a qualified veterinarian.

Bloody Milk.—Specks in Butter.

What is the cause of cows giving bloody milk? What is the cause of white specks in butter and how can they be avoided?
Deer Lodge, Mont. J. F. L.



ANSWER

Local injuries to the udder are usually the cause of this trouble. Sometimes the severe bunting by the calf is responsible; at other times the cows squeeze the udder by lying down, especially when the udder is exceptionally large and the cow is compelled to lie in a narrow stall. Violence of any kind to the udder are the common causes. Your remedy is to remove the cause.

White specks in butter are caused either by the cream drying on the surface and thus causing a small lump of casein that cannot be broken up by the churn, or by allowing the cream to become too sour, thus causing the coagulation of the casein in lumps with the same result as first mentioned. Cream that is properly ripened and not allowed to dry on the surface will not leave specks in the butter.

One Experience

with a lame horse is enough. You lost money on that one. You will never need to do so again if you will use

Kendall's Spavin Cure

the old reliable remedy for **Spavins, Ringbones, Splints, Curbs, etc.,** and all forms of **Lameness.** Cures without a blemish as it does not blister. **Price $1; six for $5.** As a liniment for family use it has no equal. Give Postoffice and Express office with your order. Address

DR. EATON J. GROSS, 153 Congress St., Troy, N. Y.

Some Jersey Records Quoted.

Was the "Dairyman" Unfair ?

ED. HOARD'S DAIRYMAN:—It seems to me that your comments on "highest butter records", in reply to "G" of Middletown, Del., in your issue of July 10, are not exactly fair to the Jersey breed. The Jersey butter records are passed over with a rather sceptical referenee to the reported butter test of Princess 2d (46 lbs.12 oz. in 7 days.) There are other great Jerseys whose butter tests may not be open to criticism in a less degree and perhaps in no greater degree than the "butter" (fat estimate) records reported by our good friends of the Holstein fraternity. The following are other recorded official 7-day butter tests of the American Jersey Cattle Club: Oxford Kate, 39 lbs. 12 ozs.; Mary Anne of St. Lambert, 36 lbs. 12¼ ozs., having a previous official test of 27 lbs. 9¼ ozs.; Oonan of Riverside, 34 lbs, 3 ozs., and in this test an analysis of the butter is reported showing 85.68 fat, 12.78 moisture, 1.05 casein, ash 0.49; Ethleel 2d,30 lbs. 15 ozs.; Ida of St. Lambert, 30 lbs. 2½ ozs. There are numerous private butter tests equally large.

It is not altogether true that seven day tests are not a reliable indication of the real dairy worth of a cow as an all-the-year-round worker. The writer has been the owner of nine tested Jersey cows, and all are, or were in their prime, great year-round workers. Of the officially tested cows above mentioned, Mary Anne of St. Lambert has a record of 867 lbs., 14¾ oz- of butter in one year. Matina of Riverside, owned by the writer and having a recorded seven-day butter test of 27 lbs., 13 oz., milked in 35 days 1,885 lbs., 1 oz., from which 111 lbs., 12½ oz. of butter was churned. Inez of Riverside, also owned by the writer and having a recorded seven-days butter test of 26 lbs., 1½ oz., milked in 21 days 1,309 lbs., 4½ oz., from which 71 lbs., ½ oz. of butter was churned. No one seeing these grand cows and their magnificent udders would doubt their capacity for year-round work, notwithstanding their high records for seven-day tests.

The Jersey is in my opinion the leading butter breed, with the Guernseys next.

Lake Co., Ohio. E. E. STEVENS.

If our correspondent had read the inquiry which preceeded the comments to which he refers, he would have seen that we were not called upon to do otherwise than we did, namely, give the highest record claimed by the different breed associations. We could, therefore, do no otherwise than cite the "record" of the Jersey cow, Princess 2d, and in doing this, we could not, in justice to ourselves, even by silence, let it be concluded that this record had the confidence of Jersey breeders as a whole. There was nothing unfair in this to the Jersey breed. Neither was it unfair to say that "seven-day tests are not a reliable indication of the real dairy worth of the cow as an all-the-year-around worker." It is not true, as a general proposition, that the cows making the largest seven day records have the largest yearly records, and it is notorious that many a cow making but a moderate seven day record, as such records go, will round out the year with records well up to the front, if not the very highest. It was this latter aspect of the case, however, that we had in mind in writing the comment referred to.

As we did not either affirm or deny the validity of the reported record of Princess 2d, but merely stated what we believed to be current opinion, so, now, we do not feel called upon to express any opinion as to the other records quoted.

RUB ON
Painkiller
and the Rheumatism's gone.

FOR SALE

My fine country home and dairy farm of 120 acres within 1¼ miles of Waukesha city limits and electric line. This farm is well watered and fenced, and well equipped with buildings painted and in good order; 10 acres wood lot, balance under plow and in high state of fertility. For particulars address
O. P. CLINTON, Waukesha, Wis.

Buy You a Ticket to CROOKSTON, MINN., and calll upon
The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains

360 acre farm, 4½ miles from Crookston, Minn, (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

WISCONSIN
Farm Lands

21 STRONG REASONS
WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to own a low-priced farm than to owe for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

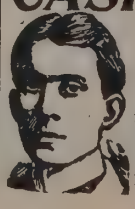
DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agricultural districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.

WISCONSIN BLUE GRASS LAND CO., Baldwin, Wis.

GOOD REASONS

why land buyers are attracted to **Marathon County** are: Because of the richness of the soil; abundance of water at little depth; fine grazing making it a very desirable location for cattle raising; excellent railroad facilities and competitive markets for dairy, farm and timber products. Central and Northern Wisconsin will be

THE COMING DAIRY SECTION



and has already made great strides in that direction, many fine herds have been established. If you want to **Own Your Own Home** now is the time to buy. Our lands are located in the northwestern part of Marathon County in a country well populated, near the prosperous village of Athens. For prices and further particulars address:

Feeding Value of Barley.

Will you please tell me what value barley has as a ration for milk cows; that is, when corn is selling for 50c per bushel and bran at $13.00 per ton, how much could I afford to pay a bushel for barley? Also what value has it as a ration for pigs? T. F. T.

Reinbeck, Iowa.

Barley carries approximately 78% of digestible units, bran 58% and corn 84%. On this basis, for merely nutritive purposes, when corn is worth 50c per bushel, barley would be worth about 42c. Compared with bran at $13.00 a ton, barley when ground would be worth about $17.80 a ton. We cannot, however, be governed entirely as to the value of the feeds by the total digestible nutrients. For example, the residual manurial value of bran is $4.74 per ton, while that of corn is only $2.24. Again, bran carries a much higher percentage of protein than either corn or barley, and where one needs to purchase or use protein, he can usually get it cheaper in bran than in barley or corn or oats, and more frequently than otherwise, the farmer in buying feeds, should aim to get cheap protein.

Barley is a most excellent feed for all kinds of animals and for all purposes. It makes excellent feed for swine, especially where one is desirious of making the highest quality of meat. It makes more solid pork than corn and seems to give a better flavor. Barley is extensively used as a horse feed in California and gives most excellent satisfaction.

Official Records of Holstein-Friesian Cows. From July 1 to 31, 1903, Inclusive.

These records are made under the careful supervision of our agricultural experiment stations. The representatives of the stations weigh the milk and ascertain the amount of fat it contains, and the Superintendent of Advanced Registry determines the equivalent butter on the basis of 85.7 per cent fat to the pound.

During the period above named reports of 22 cows have been approved, all of which have made seven-day records and one a thirty-day record, as follows:

Eke DeKol 52139 at 3 years, in 30 days: Milk 1,743 lbs., fat 53,103 lbs., equivalent butter 61 lbs., 15.3 oz.: best seven days, commencing 8 days after calving: Milk 424.6 lbs, fat 13.771 lbs., equivalent butter 16 lbs. 1.1 oz.

Winnie Wartena Netherland 37630, at 9 years: Milk 567.8 lbs., fat 19.493 lbs., equivalent butter 22 lbs., 11.9 oz. Food consumed: Oil meal 35 lbs., corn and cob meal 73 5 lbs., brewers grains "dried" 63 lbs., beet refuse molasses 21 lbs. and pasturage.

Regis Princess of Wayne's DeDol 43870 at 6 years: Milk 439.5 lbs., fat 16.254 lbs., equivalent butter 18 lbs. 15.4 oz. Owner Averill & Gregory, Syracuse, N. Y.

Nutula 2d, 43384, at 10 years: Milk 488.3 lbs., fat 15.400 lbs, equivalent butter 17 lbs., 15.5 oz. Owner, McKay Bros., Buckingham, Ia.

Akkrummer 3d's Pietertje 40861, at 7 years: Milk 437.8 lbs., fat 15.249 lbs., equivalent butter 17 lbs., 12.7 oz.

Small Hopes Aaggie DeKol 46214 at 5 years: Milk 440.1 lbs., fat 15.170 lbs., equivalent butter 17 lbs., 11.2 oz.

Aaggie Idaline Nell 44400, at 8 years: Milk 424.6 lbs., fat 15.001 lbs., equivalent butter 17 lbs. 8 oz.

Aaggie Grace's Pietertje Netherland 38354, at 8 years: Milk 466.1 lbs., fat 14.185 lbs., equivalent butter 16 lbs., 8.8 oz.

Dichter's Alemena 40257, at 7 years, commencing 103 days after calving: Milk 414.6 lbs., fat 12.101 lbs., equivalent butter 14 lbs., 1.9 oz. Owner, O. J. Godfrey, Pennellville, N. Y.

Colantha 4th's Johanna 48577, at 4 years; Milk 526.9 lbs., fat 17.282 lbs., equivalent butter 20 lbs., 2.6 oz.

Johanna Colantha 48578 at 4 years: Milk 483.3 lbs., fat 17.147 lbs., equivalent butter 20 lbs., 0.1 oz.

Clothilde Nettie Burke 48690, at 4 years: Milk 495.2 lbs., fat 13.084 lbs., equivalent butter 15 lbs., 4.2 oz.

Duchess Piebe DeKol 52348, at 3 years: Milk 509.7 lbs., fat 15.839 lbs., equivalent butter 18 lbs., 7.7 oz.

Lady May Greenwood 2d 64666 at 3 years: Milk 357.9 lbs., fat 11.318 lbs., equivalent butter 13 lbs., 3.3 oz.

Melva Parthenea 50025, at 3 years: Milk 346.1 lbs., fat 10.893 lbs., equivalent butter 12 lbs., 11.3 oz.

Adaline Dinola Hengerveld DeKol 53007—3 years: Milk 367.9 lbs., fat 10.776 lbs., equivalent butter 12 lbs, 9.2 oz.

Leda Hengerveld DeKol 53489 at 2 years, commencing 242 days after calving: Milk 239.1 lbs., fat 9.156 lbs., equivalent butter 10 lbs., 10.9 oz. Owner, McKay Bros. Buckingham, Ia.

A. L. P. N. DeKol 3d 56481—2 years: Milk 282.4 lbs, fat 8.780 lbs., equivalent butter 10 lbs., 3.9 oz.

Ruby Burke DeKol 56068—2 years, 5 months, commencing 77 days after calving: Milk 331.3 lbs, fat 8.769 lbs., equivalent butter 10 lbs., 3.7 oz.

Jewel Raphaella DeKol 55006—2 years, 6 months, commencing 208 days after calving: Milk 290.8 lbs., fat 8.455 lbs., equivalent butter 9 lbs., 13.8 oz.

Mutual Daisy DeKol 60208—1 year, 9 months, commencing 31 days after calving: Milk 261.7 lbs., fat 8.361 lbs., equivalent butter 9 lbs., 12.1 oz. Owner, W. C. Hunt, Liverpool, N. Y.

Prairie Flower Netherland Mechthilde 61263—2 years, 2 months, 22 days: Milk 271.3 lbs., fat 8.312 lbs., equivalent butter 9 lbs., 11.2 oz.

SAVES ITS COST ON THE FIRST CROP.

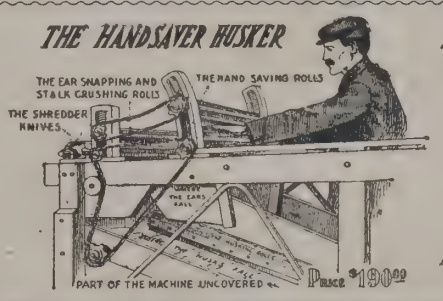
It spreads all kinds of manure, lime, salt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.

Do you know of any other piece of machinery for use on the farm of which this can be truly said?

The Improved Kemp Manure Spreader

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new Beater-Freeing Device, Apron-Returning Device and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about "How to Grow Big Crops." Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.

KEMP & BURPEE MFG. CO., BOX 46, SYRACUSE, N. Y.



New American Manure Spreaders

hold from 50 to 100 bushels. Spread just as thin or thick, fine or coarse, as ground requires. Don't have to stop team to make change. Most substantial, largest capacity, light draft.

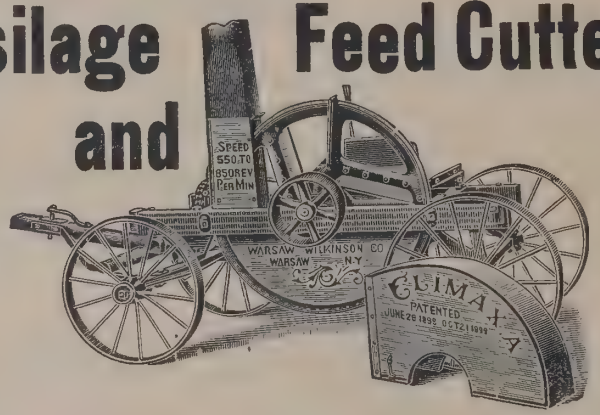
ENSILAGE CUTTER

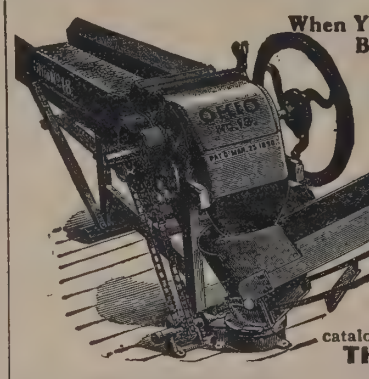


These cutters are built especially for Silo use and are strong throughout in their construction, with heavy frame built lowto avoid extra stagnig or tables to feed from. The cylinder shaft is 1¾ in. steel and has 3 babbited boxes, making 13½ inches of bearing surface. The balance wheel is closed, weighing 170 pounds, secured by side headbolts on flanged collar, keyed on the shaft; the heads of these bolts turn ¼, in case of any obstruction reaching the knives, and allow the balance wheel and pulley free speed, while the strain on the knives is relieved at once. The traveling feed table is controlled by the reversible lever and is instantly stopped or reversed. The slats on these tables travel over a close bed, full length and are close together to prevent fine leaves getting into them and winding on the rollers, also guards over the chain links. The length of cut is easily adjusted from ⅜ to ⅝ and ⅞ inches by the gears on the shaft. We furnish chain elevators of any length desired, straight away or side delivery. Weight of Cutters with traveling table, 1600 pounds. Send for circulars.

I. B. ROWELL CO.,
MENOMINEE FALLS, WIS.

CLIMAX

Ensilage and Feed Cutters.



"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

When You Buy **"OHIO" Ensilage Cutters you buy Satisfaction.**

Our absolute guarantee goes with this, our New "Ohio" Self Feed Ensilage Cutter and New Metal Bucket Swivel Carrier. It is made to be the best thing of its kind procurable. Self-feed increases capacity 33⅓% and saves 75% labor feeding.

"OHIO" Means Greatest Capacity, Least Power Required.

The man who owns one says so. All sizes, 11 to 24 in. Profit by the experience of others and get the best. Shredder blades to fit all sizes. **1903 "Ohio" Blowers are powerful machines.** Write today. Latest illustrated catalog free. Modern Silage methods 10 cents. Established 1854.

THE SILVER MFG. CO., SALEM, OHIO.

Quick, Convenient Corn Cutting

is accomplished with the Scientific Corn Harvester. It saves the crop from field waste and frostbite; does the work of a score of hand workers. Safeguards for man and horse. Too simple to get out of order; too strong to break.

Scientific Corn Harvester

cuts any desired height. Built for the hardest kind of work, but is so low in price any farmer can afford to have one. Illustrated catalogue of Mills, Sheller and Farmers' Tools will be mailed free

The Appleton Corn Husker

will do more and better work than any other machine of like character and corresponding size on the market; that it is simpler in construction; easier in every way to operate; easier and safer to feed and to require less power for successful operation. The proof of these claims is sent for the asking. We make also a complete line of sweep and tread horse powers, shellers, ensilage and fodder cutters, feed grinders, wood saws, windmills, etc. **Remember that Appleton quality is the standard of excellence.**

APPLETON MFG. CO., 35 Fargo St., Batavia, Ills.

WILDER'S WHIRLWIND

ENSILAGE CUTTERS

Run with Less Power than any Other Cutter.

Have adjustable Cutting Heads and adjustable Table Knives. Solid Balance Wheel with knives and fans attached.

TWO or FOUR KNIVES, or Shredder attachments as preferred. Stop and reverse levers.

Furnished with plain or self feed table.

Read a sample of the many testimonials which we received last year:

CENTRAL DAIRY FARM, Farmington, Ga., Aug. 28, 1902.

GENTLEMEN: The Whirlwind has arrived. Allow me to say you have given it the right name. I had an old 6 H. P. engine to run it with, and it was an old one, having considerable lost motion. When I placed the Whirlwind in motion I had great doubts about my little worn out engine giving power enough, but when I placed the belt on and began to run it I had great fear it would blow the top of my silo off. I never bought a machine that gave such perfect satisfaction. You do not say half as much good about it as it deserves.
Yours very respectfully, JAMES D. PRICE.

We have also a full line of Cylinder Cutters and Shredders with blowers or chain carriers. Write for catalogue of the MOST complete line of Ensilage and Feed Cutting Machinery made

The Wise Won't Waste

WISE dairymen don't waste cream—they can't and make dairying pay! They all finally decide to buy a dairy cream separator that will get all the cream—that will make money for them.

Many Parts, Many Pains

THEY find two kinds of separators—the Tubular Bowl, simple, swift, sure—and the old style bucket bowl, full of troublesome, uncertain parts, hard to use, hard to clean, sure to cause worry and work. Is it strange they like the

Tubular Separator The Best

When they see how perfect it is?

UNLIKE the antiquated bucket bowls used in all other separators, the Tubular bowl is small in diameter, free from discs, cones, wings, sieves, strainers, etc.—is quickly, easily and thoroughly cleaned without hurting the hands—and is guaranteed to skim cleaner, turn easier, wear longer than any other separator made. You'll know it by the low supply can and handsome design.

You can get a very interesting catalogue FREE by writing for No. 144.

California Experience With Alfalfa.

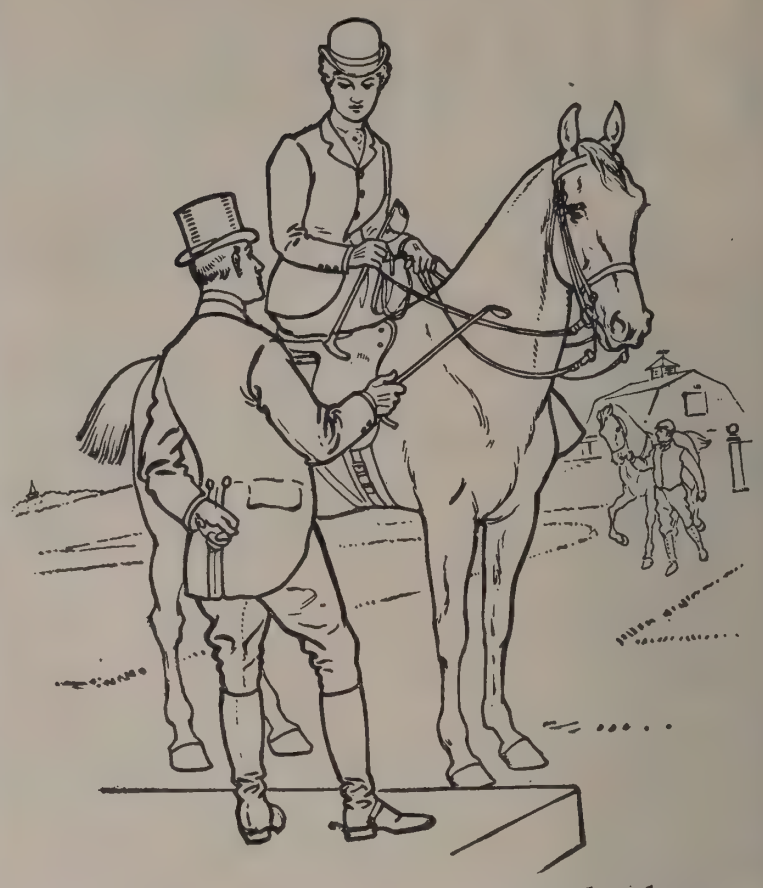
Good Results Without Grain.

ED. HOARD'S DAIRYMAN:—Inclosed please find postal order to renew my subscription to your valued and interesting paper. We (my family and myself) have been reading it for several months and we would miss it very much if we did not get a copy each week. And there has not been a month since we have been receiving the paper, but what we have had value received for a year's cost.

While I will admit there are some topics that may not interest the average California dairyman—such as warm barns, saving manure, silos and ventilating barns—there is not a person who owns or handles two cows or more but what can well afford to take HOARD'S DAIRYMAN and get good value for the money expended.

Here in Kern county we have more than an even chance in the dairy business as this country is the home of alfalfa. We have good, green alfalfa ten months in the year to run our cows on and plenty of good alfalfa hay the rest of the time. The most of us feed hay all of the time in connection with the pasture, and I think it pays.

A few weeks ago I read Mr. Clawson's letter in your paper. He thought Butler Co., Ohio, was the place to grow alfalfa. I am not wishing to argue the question with Mr. Clawson, for I was raised in Butler Co., Ohio, and know its agricultural value, but here are a few figures that speak for Kern Co., California, and I can support them. Fifty-five acres of alfalfa were mowed 5 times during the summer. The stock used to put up the hay, fed from the stacks and then the man sold the hay. It was measured on the land and he was paid for three hundred and eighty tons of alfalfa hay, that being one year's crop off the 55 acres.



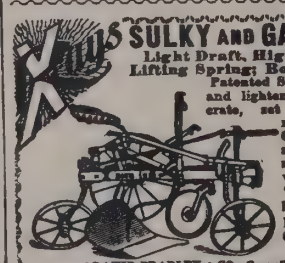
Now, as to the dairy business. I am young at it; we began last September with 16 cows, and I must say that about all that I have learned about the cow business, I have learned from your paper and I am still in the field after more knowledge. I am in favor of the Jersey or Guernsey for our line of business, which is producing butter fat. We separate here on the ranch and the creamery wagon comes every morning and takes the cream to town to the creamery. Our cows are grade Jerseys and were quite poor when we bought them last September. They began to freshen in November and during the months of December, January February and March the cows we milked, 14 in number, earned an average of $7.50 per head, per month, from the creamery, besides the calves and skim milk, and had no feed but alfalfa hay and what they could get in the pasture, no grain.

Now in regard to silos for Kern Co. I hardly believe they would pay here, as labor is high and when a cow has good growing alfalfa to run on and plenty of good hay, if some grain was added, it seems to me that they ought to respond. I am going to try feeding Hungarian millet with my alfalfa hay this winter. What do you think of it as feed, in connection with alfalfa? J. G. S

Bakerfield, Kern Co., Cal.

The editors do not accord Hungarian hay, or any of the millets, special favor. They make excellent catch crops in times of emergency. When intended for hay, abundance of seed should be used, and cutting should commence as soon as the plants begin to come into blossom, in order to prevent the formation of the hard and indigestible seed.

A more serious problem is presented by our correspondent's intimation that dairymen in his section do not need to concern themselves with the question of "saving manure." This is a great mistake. Continual cropping will exhaust the richest soils.



Gall sores and blisters cause the horse much pain. They come from heat and friction under the collar or saddle. The parts should be carefully cleansed with a pure soap that will not smart. Ivory Soap with warm water, is excellently adapted to this purpose. This soap is peculiarly efficient where it comes in contact with sores, as it is mild and pure. While cleansing thoroughly, it also soothes and heals.

MILK TUBES Patent Coin Silver 1¾" 50c. 2¾" 80c. Improved Teat Opener 75c. Dilating plug 25c. Postpaid on receipt of price. G. P Pilling & Son, 2d and Arch Sts., Ph l., Pa.

WRINGING WET Clothes dry is the reason for using any wringer. Saving clothes, buttons and money is the reason for using **Horse-Shoe Brand Wringers.** They are made with rolls of the finest Para Rubber. Every wringer is warranted. **THE AMERICAN WRINGER CO., 99 Chambers Street, New York.**

SULKY AND GANG PLOWS

Light Draft, High Lift, Powerful Lifting Spring; Boy can handle it. Patented Step carries the plow and lightens draft. Shipped in crate, set up and sharpened ready for use. Spring Clevis eases draft and saves harness. Automatic Lock on rear wheel. Celebrated "Garden City Clipper" bottoms used.

David Bradley Mfg. Co., 110 E. Broadway, Bradley, Ill.

BRANCH HOUSES: DAVID BRADLEY & CO., Council Bluffs, Iowa. BRADLEY, CLARK & CO., Minneapolis, Minnesota. BRADLEY, ALDERSON & CO., Kansas City, Missouri.

QUALITY ELMCO MARK

Elmco Mixed Feed

—ANALYSIS:—

Moisture 10.23 Crude Protein 17.90 Ether Extract 5.13

F. W. WOLL, Chemist, University of Wis., Agricultural Experiment Sta

Blended in uniform and exact proportions for stock and dairy use; consists of pure Bran, coarse Shorts and Red Dog Flour, blended so perfectly that the full benefit of each grade of feed in just the right proportion is obtained, and better than is possible if mixed by hand. **Elmco Mixed Feed** produces rich milk.

Manufactured only by LISTMAN MILL CO., La Crosse, Wis.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56. Includes postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on lable is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office orExpress Order (never by personal check), addressing Hoard's Dairyman, Fort Atkinson, Wis.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

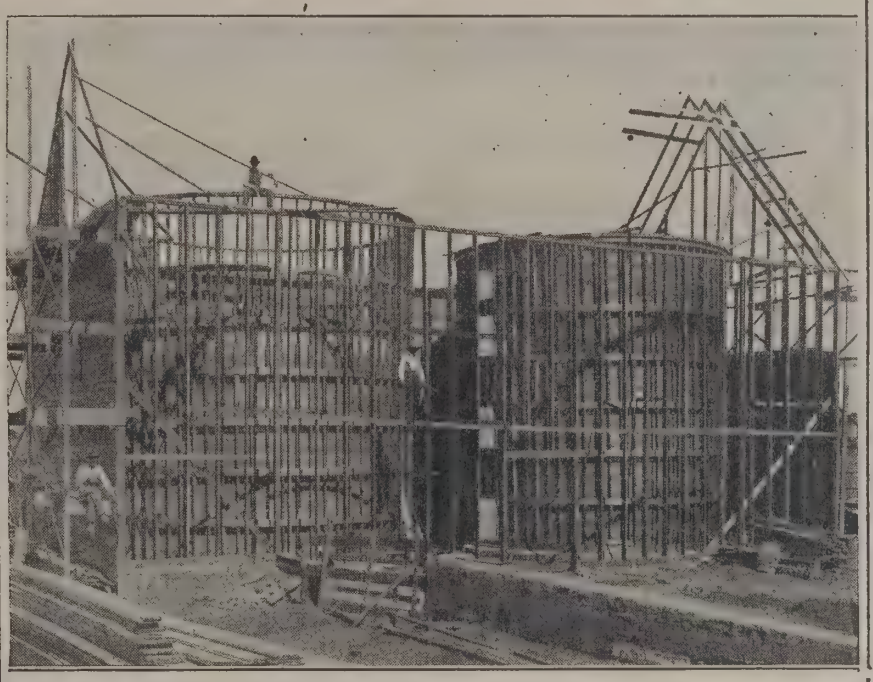
Entered at Fort Atkinson, Wisconsin, as second-class matter.

Two Iowa Silos.

Ed. Hoard's Dairyman:—I have read so much about silos, the building and the filling, also the different kinds, that I thought it might be of interest to give the readers of the Dairyman a little of real experience in the construction and filling of the much needed silo.

The picture I send you is a cut of two silos owned by Mr. Thomas of Ft. Dodge, Ia., and as I was foreman for him at the time these silos were built, I can give a plain description of them,

When I first took charge of Mr. Thomas's dairy, he had but one silo,only 12 feet square, and as his dairy was rapidly growing, I induced him to put up two silos that would be a credit to his farm. These silos are built as follows:



First I had a pit dug 5 feet deep and 25 feet in diameter. We then built a 12-inch brick wall laid in cement and plastered both inside and out with cement. Then on top of the wall we placed a double circle made of 2x6 pine; on this, we set up 2x4 studding 24 feet long. These studding were placed 1 foot apart, and on top of the studding we placed another circle, which was put up when only a few studding were placed. On the outside of the studding, we put a band of boards ½ inch by 6, making it double so as to break joints; these bands, as you will see, are 4 feet apart, and are put on merely to hold building in position. On inside of studding we first lined with boards ½x6 in., then we put on tarred paper; on top of the paper,we nailed patent lath and covered all with a good coat of cement plaster, commencing at top and finishing at bottom. The floor is also cemented, thus making it water and rat proof. The doors are placed far enough apart to insure easy access for feed. It is the intention of Mr. Thomas to whitewash the inside of each silo with a very thin coat of cement to fill any cracks, should there be any. The silos are covered by a building 30x62 feet, forming a (T), to the end of the barn, which we extended, as the wall can be seen in front of the silos, which makes the barn 200 ft. long, 40 ft. wide and 24 ft. high, with litter carriers, and also a carrier to take in silage. The barn will hold 150 cows, which I think is about as near complete in the way of feeding as one could wish, although more breathing space would not be objectionable.

E. L. English,
New Castle, Pa.

Dairy Cows.

Ed. Hoard's Dairyman:—The quantity of milk yielded by a cow depends primarily on her milk yielding capacity. The question of food is only a secondary consideration but yet of vital importance, while the general management of the cow has a beneficial or adverse effect, according to whether it is correct or otherwise, on the milk yield. Other factors that also influence the milk yielding capabilities of the cow are the age of the animal, the yield generally being greatest after the animal has had her third calf, and, secondly, the time of the period of lactation; at the commencement of this, a larger quantity of milk is yielded than towards the end, as the cow dries off.

The operation of milking itself also influences the quantity of milk; a good milker will draw a larger quantity of milk from a cow than an inexperienced milker. The last point is frequently being overlooked, although it is a very important one. More especially in the case with young cows, great stress should be laid on having them milked by an experienced milker, and that the milking is not performed in a slip-shod manner. In a large herd of dairy cows, the extra quantity of milk obtained by employing good and experienced milkers, as compared with careless ones, is not inconsiderable. If a fair wage is paid, one is in a position to employ only the very best

The cut shows two silos, each 24×30 feet with cemented walls and cement floors, costing about $600.00. Property of Z. W. Thomas, Fort Dodge, Ia.

of workmen, and the extra expense entailed in paying good men is more than counterbalanced by the extra quantity of milk obtained. In some countries, the cows are milked three times a day, and we are told that a larger quantity of milk is obtained than if milked twice. But, for many reasons, this method is impracticable. In the first place it must be remembered that considerable more expense and labor is involved; and the manner in which we feed our cows, renders it quite impossible for such a method to be carried into practice and in many cases it is doubtful whether the additional quantity of milk covers the extra expense incurred. All these various factors mentioned as influencing the milk yield in a beneficial or adverse manner, are, however, of minor importance.

As already pointed out, the question of milk yield of a cow depends chiefly on her inherent milk yielding capacity. This is a hereditary quality, and, such being the case, the milk yielding capacity of a herd of dairy cows can largely be increased by careful selection and breeding. In herds where a large milk yield is desired, special attention must therefore be paid to the drafting into the herd only those heifers which have been bred from the best, or, at any rate, good milkers. The heifer calves from poor or indifferent milkers, should on no account be retained, as they will have inherited the poor milking qualities of their mothers.

By selecting the heifers as just described, and continuing this process for a sufficient length of time, the average milk yield of a herd will be considerably increased. It is not sufficient, however, to insure that the dams of the calves retained for drafting into the herd are good milkers. Earnest attention should be paid to the class of sires that is used in the dairy herd. The sire should, if possible, be bred from a deep milking strain. This point is one of great importance, but very often entirely neglected. A great many dairymen pay little or no attention to this matter, but use any kind of an animal so long as he can get calves; this characteristic is usually more prominent with mongrels than with animals of good breeding.

In some instances, the selection as regards the dam of the heifers retained for placing in the herd, is judiciously carried out, but little, or no attention is bestowed on the question whether the bull used for serving the cows comes from a deep milking strain and, besides this, has a heavy milker for its dam. On the contrary, not unfrequently entirely unsuitable bulls are used in our dairy herds—bulls, it is true, which perhaps have pedigrees as long as one's arms, and which would please almost any judge, but whose services in a dairy herd had better be dispensed with. The use of a bull whose immediate female ancestors were, or are, poor milkers, in a dairy herd, is much more to be deprecated than the breeding from a poor milking cow and retaining her produce.

It must be remembered that the bull influences the milking qualities of all the heifers in the herd. This evident fact is frequently overlooked entirely. Unless, therefore, the breeding of the bull used for service in the herd is attended to, little and uncertain progress can be made in the improvement of the milking capacities of the heifers bred, and which are eventually drafted into the dairy herd. In fact, by breeding from a bull descended from a poor milking strain, the benefit accuring from retaining for breeding purposes only good milkers is to a greater or lesser extent negatived, according to the degree of prepotency of the bull. Only if both parents are descended from good milkers can it be expected that the progeny will be good milkers.

Breeding from a good milker whose parentage is unknown will not invariably produce calves which later on will also give a large milk yield. Breeding from animals whose parentage is unknown, and which are cross-bred, must at the best of times, be only guess work, and very uncertain and unsatisfactory in its results. We may possess a cow which is a heavy milker, yet her heifer calves may altogether fail to possess the same desirable quality. As a rule, however, it will be found that good milking cows produce equally good milking heifers, provided they have been bred to a suitable bull, as pointed out above.

This is due to the fact that deep milking generally comes from good milking families, and that their milk yielding capacity is an inherited quality, and not of accidental appearance; if it were not so, it would not for certain be transmitted to the offspring. In selecting the cow from which to breed heifer calves for drafting into the herd, the best test of their usefulness and suitability is, of course, to keep a careful record of their daily milk yield. In fact, it is absolutely necessary to follow this plan if satisfactory results are to be obtained, although it cannot be denied that some extra trouble is involved thereby. At the same time, the benefit resulting from knowing the actual milk record of each individual cow in the herd amply justifies the extra trouble and labor entailed. In all cases, it is the most satisfactory and simplest way to weigh the milk.

A simple machine for this purpose is found in the market at the present time. It is an evident fact that good milch cows possess certain outward signs, which to some extent aid us in forming an opinion as to their suitability for the dairy. Yet this point is of minor importance. An accurate result as to the milking capacities of a cow can only be gained by keeping a milk record. The characteristics of a good milch cow are, of course common, to a greater or lesser extent, to all cows belonging to dairy breeds or crossbred cows produced by crossing the former. Although we are able to distinguish to some extent by means of the outward conformation, a cow that is likely to be a fairly good milker from one which is a poor milker, yet it is impossible to say, by judging from the outward appearance of a cow and the size of her udder, etc., whether she will yield 500 gallons or 1,000 gallons per annum. This fact can only be established by carefully recording her daily yields.

The size of the bag is, of course, one of the principal points on judging of the usefullness of a cow for dairy purposes. Size, however, is not the only point; texture is also of importance. By no means are the size and texture of the bag an infallible guide as to the milk yielding capacity of a cow, although it is not infrequently assumed to be so.

The shape and size of the udder, of course, varies in different breeds; even amongst the various dairy breeds uniformity in regard to this point does not exist. On the contrary, the dairy breeds of this and other countries possess udders of different type. As an example, the typical udder of an Ayrshire may be seen, which is quite different to that of a dairy Short-horn cow, although both may be good milkers.

The size of the milk veins is also an indication of good milkers. Other characteristics which invariably indicate good dairy cows are the following: A wedge shaped body, a smallish head, comparative narrowness of the body in front and wideness behind, large roomy belly, wide and projecting hips, and a skin of good texture. A dairy cow is not, however, a good milker because she possesses these characteristics. It should be the other way about—that is to say, because a cow is a good milker, therefore she possesses those points we are accustomed to look for in a dairy cow. In breeding dairy cows, stress must therefore be laid on the actual milk yield. If this is done, the outward points which characterize the build of a good milker will not fail to put in an appearance.

To breed dairy cattle from their outward conformation alone,is entirely wrong and can never tend to improve the herd, as far as milk yielding capacity is concerned. As pointed out at the commencement of this article, the feeding of cows is of secondary importance when compared with the individual milk yielding capacity of a cow. At the same time, the question of feeding is a very important one, and its importance cannot be over estimated. Putting it briefly, I may say that only those cows will respond to liberal feeding by giving an increased quantity of milk, which are really good milkers and possess good milk yielding capacities. Cows, on the other hand, which are not naturally deep milkers, can never be made so by feeding.

In their case the food supplied would not be converted into milk, but stored up in the body in the form of fat. In discussing the above points I only considered the case of dairy herds where the production of milk is the sole object. Where cows are bought and drafted into the dairy herd and later on sold to the butcher when they cease to give satisfaction, other points in regard to feeding must be considered.

Australia.

Prof. Haecker advocates the inspection of cream, and the rejection of all that which is not good at central plants the same as at local creameries, and the professor is right.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

NATIONAL DAIRY UNION MATTERS.

Owing to a press of other duties, W. D. Hoard has resigned his position as President of the National Dairy Union.

Chas. Y. Knight, Secretary and Treasurer, requests HOARD'S DAIRYMAN to announce that a complete financial report showing receipts and expenditures of the National Dairy Union to date, will be made as soon as the books can be audited.

BUFF Jersey of Monmouth, Ill., has issued the third edition of his book on Practical Dairying. As the work of a practical dairyman and farmer, the book is to be commended. There is much practice and little theory in it. It contains much valuable material on the dairy herd, its feed, care and management; stables; calf rearing and management; building and filling silos; soiling crops, refrigerators, feeding and care of swine, etc. When a farmer has made a success on certain lines, his advice is proportionately valuable and the book will be a help to anyone, be he a beginner or an old hand, who wishes methods that have been tried. The price is 75 cents, postpaid.

EFFECT OF SALT ON THE COLOR OF BUTTER.

Prof. G. L. McKay, of Iowa, illustrates this point as follows:

"If you were to take three samples of butter from the same churning, add no artificial coloring, salt the one lot a half ounce, the second an ounce, and the third one and one-half ounces, the third lot will be higher in color than the first lot."

This shows the importance of considering the amount of color to be used in connection with the amount of salt per pound.

SAVE ALL THE FODDER.

It is evident that there is going to be a heavy demand for hay from the east. In that event we would earnestly advise all readers of the DAIRYMAN to save all the corn fodder they can. Very much of the corn in the west will be good for nothing except for fodder. But if it is carefully saved, there will be a chance to sell some of the hay, and a cash crop obtained in that way.

The man that is saving of his fodder, and saves it when in the best feeding condition, generally has the bulge on good luck.

ADVICE THAT WAS MUCH APPRECIATED.

Just before we were about to address the New York Dairymen's Association, at Olean, two years ago, we shook hands with a kindly-faced, sturdy old New York dairyman who gave us the following advice:

"Speak your mind and conviction squarely. Don't be afraid to talk to us just as you think. Call a spade a spade. We can stand it. If you are right we will feel it and know it. What we need in these times is plain, faithful talk that don't leave us a peg to hang on where we are wrong."

There was was a brave, earnest man; a hard thinker and worker in his chosen sphere of life. Politicians are never made of such stuff, but real statesmen always are. It takes high courage to face the truth about ourselves, and that is the reason there are so many self-loving cowards.

KEEPING COWS CLEAN.

In that little book "Thirty Years Among Cows," by N. B. White, are many nuggets of cow wisdom. The chapter on keeping cows clean, should be read about once a week, by every cow keeper in the land. There is an old saying that: "Familiarity breeds contempt." It must be the familiarity some men have with cows, that makes them so indifferent and contemptuous about keeping them clean. And yet cleanliness is the most important of all considerations, whether we consider the health of the cow or the quality of her product. Some men rarely have a sick cow; others are having sickness among their cattle all the time. Care and cleanliness makes healthy cows, and *healthy* cows, are much more profitable. Some of the sayings of Mr. White in the above mentioned chapter, are worth remembering. Here is one of them:

"When a boy goes to school, he begins to learn the first day; but I had been in this cow school more than twenty years before I began to learn ahything about keeping cows clean in the stable."

Last April a half dozen farmers from Illinois came in a body to inspect the barn and stables of the Senior Editor of this paper. They saw 43 cows, many of them with white flanks and thighs, that had been in the stable 20 hours out of 24 every day since the early part of the November previous. These men expressed great surprise at the absolute freedom of all manure or even manure stains, on the bodies of these cows. They asked how often we washed and groomed our cows, and they looked very incredulous, when told that the cows were never washed and rarely ever brushed. Each of these men used the stanchion plan for tying their cows. But they admitted that they had received an object lesson on keeping cows clean, that would not soon be forgotten. Like Mr. White they had been to school for years, but had learned nothing.

Here is another of Mr. White's sayings:

"In the Northern states, for six months in the year, one-half of the cows have their sides covered with manure, some portion of which goes into the milk pail every day."

And thousands of farmers, with cows answering that description, will tell you their "cows are clean enough," and their milk cans when emptied at the creamery, will show enough manure in the bottom to make a cow ashamed of her owner. And such are these men's ideas of what is clean and wholesome. Surely, "familiarity breeds contempt."

MORE ZEAL THAN WISDOM.

For several days the Chicago papers have been filled with articles on the milk question. It seems that the Board of Health of that city have been investigating the milk supply. They found it low in butter fat and other milk solids; too low in fact for the health and welfare of the children of that city.

Being without practical knowledge on dairy questions the Board rushed off into a raid on the Holstein breed of cattle, asserting that they give milk too low in solids for human nutrition, and so we see numerous articles in the papers bearing the caption "The Holstein Cow Must Go," The Holstein Cow Condemed," etc. Chief Milk Inspector, Thomas F. Grady, Irishman like, proposes to hit a head wherever he sees it, whether good sense accompanies his blows or not, and so he has started out ten young doctors as milk inspectors. It is not likely one of these doctors knows a thing practically about milk, about methods of testing, or even very much about the nutritive value of milk. The dairy farmers who supply milk to the people of Chicago are to be raided by a Board of Health of very deficient cow knowledge; led by a milk inspector who if he is correctly reported is simply an uninformed breed crank, and a lot of callow medics who wouldn't know a Jersey or Ayrshire or Holstein from the veriest scrub.

The difficulty with the milk supply of Chicago is not one of breed but rather because of inefficient laws and administration. No matter what the breed the milk is taken from, unless the authorities pursue a rigid system of inspection by competent men, and not a bunch of half fledged doctors, the people will be likely to buy their milk. Average Holstein milk tests about 3 per cent. That makes very good milk. It is not worth as much commercially or in a nutritive sense as five per cent milk but it will do very well and there is no sense or reason in holding the Holstein breed of cattle responsible for the dishonesty of dealers and certain milk producers. The Chicago Board of Health in this matter are showing more zeal than sound judgment.

RIGHT TO THE POINT.

That was a broad, sensible argument that was put forth by a farmer in Northern Wisconsin the other day, in a meeting that was called to consider the building of a creamery. He said:

"I want a creamery here for several reasons. (1) For the purpose of having a central school house in our midst to teach us all what we ought to do in this business of dairying. We are all too ignorant of what we ought to know on this question, and if we can get a good creamery here it will teach us. (2) I want a creamery here to rescue honest milk from honest cows from making dirty butter that goes into dirty grease boxes, in dirty store cellars and is traded off at last to make process butter of. Our farmers get a low, dirty price for all this dirty butter. It is an outrage on the cows, a serious loss to us in money, and I for one am heartily ashamed of it. I don't want to help along the process butter business any more."

The Ideal Cow Aimed at on Robinswood Farm.

Her Structure as Outlined by a Scale of Profit.

[Dr. J. M. W. KITCHEN in *Jersey Bulletin*.]

The following will be read with interest by all earnest students of the dairy cow, for the reason that it presents the ideal or standard that Dr. Kitchen, himself an earnest student, carries in his mind as a guide in the breeding and selecting of his cattle. It will be noticed that the Doctor studies the dairy cow from his knowledge of the physiology of the maternal functions, which constitute the real foundations of all intelligent judgment on such questions: He says:

I await with considerable impatience the collection and collation of sufficient accurate data that will confirm my various personal beliefs as to dairy cattle ideals that are the outcome of my observations; and that will enable me to alter my ideals in consonance with scientific information relating to breeding matters. Until such information is at hand, I must hold to my belief that it is a very good cow that without being oversized, or without forced feeding, will produce 350 to 400 lbs. of butter a year (15 per cent overrun), and who also throws healthful progeny of equal productive powers to herself, for six or eight years of her life. I do not believe that a 600-lb. two-year-old heifer that will produce 6,000 lbs. of rich milk in her two-year-old form will win out in comparison with the first named style of cow. I challenge anyone to show that such an immature producer has ever existed that threw desirable progeny, or that was a profitable cow in the long run. A thin-milk cow might do it; but not one that runs so much of her digested nutriment off through her udder as a small sized, rich milk producer would, if producing such a large quantily of milk.

Now as to my ideas in regard to a scale of points, the four great and most important features of a good butter cow, and in proportionately important sequence, are:

1st. A very large development of the intestines, liver, pancreas and other abdominal organs, except the stomach, which would be relatively rather secondary in this development as compared with that of the specialized milk cow; i. e., a cow producing a large flow with small fat percentage.

2d. Sparsely developed general muscular and bony systems. The bony system being fine to moderately coarse, according to the nature of the pasturing work to be done. The general muscular system to be very spare in every type; because no good dairy cow ought to be overworked in securing her living at pasture.

3d. A highly developed spinal and sympathetic nervous system. A large development of the nerve centers of these systems is needed to secure a sufficiently long and full flow of blood to the udder during the milking process; this being affected by the so-called inhibitory influences whereby the muscular coats of the arteries are relaxed.

4th. A mammary development that shall be large in relation to the general weight of the animal.

It is a uselessly excessive general weight that counts high in the cost of food of support. The other points in a cow are of lesser importance, and should be rated accordingly. A cow does not need a large lung development, as in the case of the horse. We don't run our cows, or at least ought not to do so. Nor do we put a big amount of work on her in a short time. The cow's work is spread out during the twenty-four hours; and hence does not require extraordinary size of lungs. Her heart wants to be strong enough to drive her blood strongly throughout her whole body, and if she and her ancestors get a sufficient amount of exercise it will be all right. The longer her stabling season, the stronger should be her heart action, to counteract tubercular and other germinal diseases. Therefore, great chest development is not a *sine qua non* in the dairy cow. The wedge shape frame is all right.

I herewith append a scale of points that will give a somewhat fair idea of the valuations that I consider should be attached to each group of features:

SUGGESTED STRUCTURAL IDEAL, AND SCALE OF POINTS.

Head (4 points): Small and lean, Eyes full, prominent and placid. Jaw strong. Muzzle large and broad. Nostrils large and open. Face straight, broad between the eyes, narrow between the horns. Horns small and incurved.

NECK (2 Points:) Thin, rather long, clean cut throat and not heavy at shoulders (ewe-necked.)

WITHERS AND CHEST (2 Points): Thin from side to side. Sharply wedge shaped, with apex of wedge at top.

SPINE (10 Points): Large and level between shoulders and rump. Vertebrae well apart; spinous processes prominent. Pelvic arch markedly prominent. Spine carried level from pelvic arch to setting on of tail.

TAIL (1 Point): Thin, long, reaching hock, with a good switch, hanging free from thighs.

BONY FRAMEWORK (10 Points): Fine to medium in weight. Pelvis broad across the loins. Ribs well rounded, with large interspaces. Angular points of the frame prominent.

BARREL (25 Points): Long; abdomen broad and deep at flank. Flank highly arched.

LEGS (1 Point): Short, or of moderate length.

APPROXIMATE WEIGHT (10 Points): At 2 years old, 600 lbs. At 3 years old, 700 lbs. At 4 years old, 800 lbs. At 5 years old, 900 lbs.

GENERAL MUSCULAR SYSTEM (20 Points): Very sparsely fleshed and free from fat. Thighs incurved (cat-hammed); shoulders thin. General lack of beefy points.

UDDER (15 Points): Capacity large in proportion to general weight of body. Shape approximating that of a globe. Quarters symmetrical, carried well up behind and full in front. Teats rather large, graspable with the whole hand, squarely placed and set moderately wide apart; hanging perpendicular. Milk veins prominent and tortuous; milk holes large.

I do not suppose that it would be possible to formulate any arithmetical scale of points that would be scientifically ideal. Nor do I see any need of such a formula. No cow should be judged, in my opinion, apart from her individual

functional powers and her innate hereditary tendencies.

The matter of color should not be considered; disposition, general appearance as to constitution, and condition of hide, should be classed with a functional rating. A dished face is not a merit in a cow. The nasal cavities should be large and straight. Most so-called dished faces are really only so in appearance because of the prominence of muzzle and eyes.

In rating the bull structurally, allowance must be made for heavier form at the head end of the animal and a lesser development at the pelvis. Still he must be the antithesis of the beef bull. His milk veins should be conspicuous, and his rudimentaries at least moderately large, and should be squarely placed and set well apart.

Such a formulation as a scale of points is not entirely satisfactory to me, and I have never seen one that was. This scaling would evidently not suit those who bank on fancy points. But such points are matters of taste, while the rating I have given would be a fairer preliminary to an entrance to an advanced registry, if a scale of points rating is to be considered as a requisite to such entry.

Criticism will of course be directed to the rating I have given the udder; but if the other more highly rated characteristics are marked, I should not worry much over the udder if it only looked poor, for the milk will be likely to be poured out through the udder even if it is not in the fashionable form of the Island creations of this day. So many beautiful, symmetrical udders are being sent over to us in this day that I am beginning to think that a very large amount of udder work has not been demanded of the ancestry of the young things carrying such beautiful mammary appendages. Otherwise we would see more udder distortions among their descendants.

One statement of the Doctor's puzzles us a little to know just what he means. It is found in the paragraph, in the scale under the head "BARREL," where he says: "Abdomen broad and deep at flank; flank highly arched." We would say, how can the flank be "deep" and at the same time "highly arched?" This confusion arises from the habit of calling the whole of the lower belly line the "flank."

HOARD'S DAIRYMAN has for years used the word flank as applying only to that portion of the belly, just forward of the stifle. When of proper shape it forms a sort of archway to the udder. The beef outline drops this arch way down to the lower line of the belly, thus shutting out almost entirely all side view of the udder.

The Doctor's ideas of the structural build of the dairy cow are in very close accord with those entertained by the DAIRYMAN.

White Whey in Cheese Making.

ED. HOARD'S DAIRYMAN:—I am losing considerable white whey after milling. What is the cause it, and what is the remedy to overcome it? I thought too fast working curd and too much acid was the cause of it, but in my case it don't prove to be true. A. N. F.

Pomona, Mich.

In the superfluous flow of white whey after the milling or grinding of the curd, much butter fat is lost. The fat liquifies and escapes with the whey. This being true, I shall treat the question as one of loss of fat rather than loss of white whey.

There are several causes for this loss of fat; a good deal, for instance, is lost in the whey at this time of the year when the milk is often times far advanced or over ripe, requiring fine cutting and rapid heating to high temperature in order to secure the cook prior to the development of the acid. Another cause is, if when the whey is drawn off, the curd is not in a proper condition—that is, if it is still soft, insufficiently cooked or firmed and charged with whey—there will surely be a loss of fat, as the fat is not really detached in the intersticies of the curd, and that under the action of the lactic acid or acids, (as chemists tell us that other acids are formed after the development of lactic acid), the condition of the curd changes and its texture weakens to such a degree that it cannot resist the action of the curd mill and at the same time retain the fat.

I have noted from observation that some makers experience an additional loss of fat by grinding the curd at too high a temperature. They will dip the curd that has been firmed at 98 to 100° F. in the whey, and after racking, by means of placing hot water under the racks or turning live steam directly into the vat under a tight fitting canvass cover, maintain this temperature, or even raise it two or three degrees above the firming temperature used, holding it at this heat up to the time of grinding. The curd when too hot, is not firm enough and instead of being cut is torn apart, thus putting the texture in bad shape, and to this is added the influence of the too great heat, which softens the curd; thus the loss of fat in such cases, will be easily appreciated.

Still another cause, and perhaps the most common cause for the loss of fat, is due to bad milk; milk that has not been properly cared for at the farm, and delivered at so low a temperature as to defy detection until having been warmed up in the vat, resulting in bad flavor and gassy curds. This is important to the milk producer, and he should bear in mind that badly cared for milk, always occasions a loss of yield.

Among the precautions to be observed is that the curd is invariably in a good condition of firmness and elasticity, also that the pieces or cubes are distinct from each other, at the time of drawing off the whey.

There are two methods of rapidly hardening the curd at this stage of the process; one is by vigorous hand stirring at the time of racking the curd, which invariably means a loss of fat; the other and preferable method is to draw the whey down near the curd, and by the extra heating of the curd in the remaining whey just previous to racking, the action of the rennet npon the curd is stimulated, and the whey is expelled without the harsh treatment of much hand stirring, and without loss of butter fat.

A uniform temperature of from 96° to 98° F. should be maintained during the process of matting and maturing up to the time of milling or grinding, when the curd should be cooled to at least 92° or 94° F., before going through the curd cutter.

Knife mills that have clean, sharp cutting surfaces, cutting the curd into uniform cubes should always be used in preference to any style of peg mill. Curd ground with knife mills requires but little handling or stirring at this particular stage, while peg mills tend not only to bruise and tear the curd, but liberate the butter fat, and require almost constant stirring, up to the time of salting, in order to keep it from matting back into one mass, and to insure an even distribution of the salt.

We should constantly keep in mind that the butter fat is largely freed from the effect of the casein, which holds it mechanically, and that by too much hand stirring and manipulation of the curd at the time of racking, grinding and salting we are continually liberating this fat; but by careful handling in every part of the process, and by cooling the curds previous to grinding, we fix the butter fat and retain the moisture and fat in their proper positions. U. S. BAER.

Wisconsin Dairy School.

A good cheap stable for 14 cows. This stable 16×42 feet was built in 1897. The material cost $1,200 and the work was done by owner. Interior of stable shown in cut below.

All this stable needs to make it sanitary is a tight floor overhead, the interior whitewashed, ventilators and more windows. All this could be done at an expense not to exceed $30.00.—Illinois Experiment Station.

AN intelligent (?) milk inspector of Chicago has discovered that white clover is responsible for the sour milk that is common in Chicago this summer. The reasoning is very clear: Chicago has much sour milk, Wisconsin and Illinois, the sources of the milk, have a heavy growth of white clover; the relation is obvious!

THE large creameries which churn a large quantity of cream at a time have considerable advantage over those which churn a small quantity. It has been found by experiment that the larger the amount of butter at a single churning the greater will be the overrun. Smaller amounts of butter do not absorb as much water proportionally as do the larger.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Ice House.

Please answer through your paper plans for an ice house, viz: Drainage, ventilation and side walls using unmatched, white oak boards, size 14x16x13 ft. What does 1 cubic foot of ice weigh? Also how to make a pond in a sandy loam bottom that will not leak. Your paper comes regularly.
W. Va. S. P. B. & S.

A porous soil makes the best drainage for an ice house. Where this cannot be had, drain pipes or tile must be used, but these must be securely trapped in order to prevent the air coming through the pipes and reaching up to the bottom of the ice. This so-called trap is simply a bend in the pipe a little deeper than the diameter. This being constantly full of water, prevents the air from entering. At the bottom of the ice house place some poles or scantling and cover well with straw so as to lift the ice a little above the ground.

For ventilation, build a cupola in the roof about two feet in diameter. This may be of wood with slatted sides with a roof, or it may be of galvanized iron with sufficient space between the top and the sides to allow the warm air to escape.

While unmatched boards do not make the best covering for an ice house, they may be made to answer a very good purpose by filling in the space between the outside covering and the inside ceiling with saw dust. This space should be nearly or quite a foot in thickness.

It will be found a pretty difficult matter to make a pond in sandy loam that will hold water. The only way to do it would be to get a very considerable quantity of clay and spread over the entire surface, thoroughly wet and then mix and puddle the same and let it settle.

A cubic foot of ice will weigh approximately 57½ pounds.

A Round Barn.

I am thinking of building a round barn on my farm and would like to have your opinion on such a form of barn. Can a hay fork be easily arranged in such a barn? Could you refer me to parties who are using this form of barn? G. H. C.
Storm Lake, Iowa.

It is undeniable that a round barn presents many admirable features, but whether these on the whole outweigh some disadvantages is with us, as yet, an unsolved problem. They are economical, both in lumber and labor, affording more storage and stable capacity for a given expenditure than any other form. There is no difficulty whatever in putting up a circular track for hay fork to run on so that hay may be delivered wherever wanted. See illustration of a round barn in process of construction in Vermont on page 547. There is a barn of this character on the King farm, easily reached from either Fort Atkinson or Whitewater, and this is, so far as we are advised, the only structure of this kind within reasonable distance of our inquirer.

Wood Covering for Cement Floors.

I note that you recommend two inch plank over cement floor under cows. Would there be any objection to using inch boards instead of planks? How would you provide for securing planks to floor when constructing same? A. C.
Arcadia, Wis.

The probabilities are that inch boards would make a fairly satisfactory covering for a cement stable floor, but it is doubtful if two floors of this kind would outlast one floor made of two inch plank. With plank it would probably be unnecessary to do more than lay them down loose, or a batten might be nailed across at intervals where the partitions between cows should stand.

Butter Fat in Buttermilk.

I am leaving two spaces of fat on a two-neck Ohlsson bottle, and have 1,400 lbs. of buttermilk. How many lbs. of butter do I lose daily.
Dannemora, N. Y. BUTTERMAKER.

The fat left in the buttermilk probably amounts to about three pounds, which indicates very close churning.

Directions for Testing Cream.

Will you please tell me where I can get directions for testing cream. Is the dairy size turbine separator a success? I am under the impression that the speed is hard to control. Is that the case? C. L. D.
Bowling Green, Ky.

You will find full directions for cream testing in Testing Milk and its Products by Farrington & Woll. It can be obtained from this office for $1.00 postpaid. We have heard no complaints concerning the turbine tester; they are accurate when properly used.

Mr. Grote's Rations.

ED. HOARD'S DAIRYMAN:—It has indeed afforded me great satisfaction to read the article by Mr. Grote on page 558. Isn't it strange that people will keep following old fogyish ideas, and to do their work in the most laborious and expensive way, simply because their forefathers did their work in that way.

HOARD'S DAIRYMAN has ever since its existence preached the idea of buying high-priced concentrates, not as a matter of economy, nor simply because such concentrated by-products were on the market and had to be bought and fed, but simply because no one had ever taken the pains to figure out a cheaper home-grown ration.

Mr. Grote, as a result of his discovery and scientific investigation, is surely destined to become the greatest of men among kine. A genius that can figure out a five-cent ration that will equal or excel the old-time 15-cent stuff is surely entitled to a place in the front rank, among the few really great men of modern times.

HOARD'S DAIRYMAN should in all justice to its patrons lock up the office, and turn over the key to this son of toil from Mauston, Wis., and make suitable apology to the subscribers for their past misguidance.

It is a remarkable fact that providence always affords relief at the proper time. Had Mr. Grote lived and made this phenomenal discovery years ago, the millers of the country would have been compelled for want of buyers, to throw their bran, shorts, middlings, etc., into the river, which would have resulted in a great loss. But now, and in the future, since fuel is so very scarce, all this can be utilized to good advantage.

I fancy now I can see the farmers of the wheat-growing prairie states, ever and anon lifting the huge bucket of bran to the top of the stove and throwing a few handfulls on the smoldering fire to keep their measly forms from freezing while the winter lasts and the coal strike is on.

But please do not waste time on such thoughts but think of the future dairyman who smiles as he stuffs his cows with a 5c ration of such simple feeds as corn stover, marsh hay, oat straw, with possibly a sprinkling of corn and bean silage or alsike hay.

Mr. Grote has proven, beyond the shadow of a doubt, that these named feeds in the manner that he has proportioned them in his recent article contains as much and even more nutriments than those which have been continually thrust before the dairymen's shrunken countenance by the dry and monotonous formulas of HOARD'S DAIRYMAN. The logic in that article will refute all probable contradiction.

HOARD'S DAIRYMAN might hint at his

FOUND OUT.

What a Mother Found Out About Food.

A mother found out what a change of food can do for a whole family, from the nursing baby to the adults, in this way: "Twice during the summer months my baby was taken violently ill and was very slow getting over the attacks. His former diet of cow's milk alone ceased to agree with him so I combined it with an expensive infant's food but he soon became very much constipated.

"Then I shifted to Grape-Nuts food and found that this was just what baby needed, adding it to his milk after softening in hot water. Baby has thrived upon this food and is now healthy and strong and chubby as any mother could ask which you know is saying a great deal.

"It did not take me long to find out that a saucer of Crape-Nuts and cream is just what is needed by the tired nervous mother and I have also proved to my own satisfaction that when the children are old enough to chew Grape-Nuts it is far better for them than oat meal or any other mushy food for it develops their teeth and helps their digestion and their minds seem much brighter and more active too.

"Truly here is a wonderful food and one for the entire family." Name given by Postum Co., Battle Creek, Mich.

There's a reason.

Look in each package for a copy of the famous little book, "The Road to Wellville."

1,200,000

U.S. CREAM SEPARATORS

This seems a great number of separators. Does it not? It is a great number, but these figures are as easy to make as smaller ones—and, as our "would-be competitors" make their figures

400,000

and we sell three separators to their one, the reader can see our figures are within the FACTS—

POUGHKEEPSIE, N. Y., March 1, 1902.

Fifteen years ago last October we started our creamery on the co-operative plan recommended by your agent, fitting the building with machinery from your Company, and using the Cooley Creamers for the patrons. We have run on this same plan for all these years until Sept. 1899, when we put in separators. Our patrons are using more than three to one of the U. S. Separators over all other makes, and we believe the U. S. Separator to be the best on the market.

We are still working the cream gathering plan, and believe it to be the best for the rural districts, where unavoidably some of the patrons are a long distance from the creamery. We are satisfied with it, because we believe it to be the best and the cheapest. No farmer can afford to hitch up and carry his own milk, even if he live within half a mile of the creamery, if he can get it done, as we have this year, **at the average cost to each patron per day of 9 cents, and some years for less.**

H. R. HOYT, President La Grange Creamery.

Bear in mind that the main factory of the De Laval Co. is at Poughkeepsie, and that that company boasted that no other separator could be sold in their county.

Champion Milk Cooler Co., 67 Main Street, CORTLAND, N. Y.

rations being less digestible, but to offset that kind of weak argument he has already given his rations enough more nutrients to make due allowance for all possible discrepancy in that direction.

The only danger that I can see in connection with the new formula, if practiced by all dairymen, which it undoubtedly will be, is that a great many, who have in the past been feeding short rations on account of enormous feed cost, will underestimate the value of their cheap home grown feeds at first; but when, in time, they see the enormous profits from such cheap feeds they will become enthusiastic and in trying to crowd their cows will overfeed them simply because the feed is cheap. The consequence of which will be a ruined lot of cows.

Of course we must all learn and adapt ourselves to the new order of things. In fact no great advantage has ever been gained without some slight disadvantage; and cases are on record where the disadvantages have outranked the advantages. Be this as it may, however, I hope to see the time when cows will be so liberally fed on cheap, home grown feeds, that their increased nourishment, will so stimulate their milk organs, that the act of milking will hardly be necessary. But the simple act of shoving the bucket under the cow, and a little rattling of the bucket at the same time, accompanied by a few kind words(oaths) from the gentle milker, will excite the udder into action, and stream forth its creamy juice, so that only a few strippings at the latter part of the milking, will have to be taken by hand.

Possibly my imagination has been a little too hasty in the above, but I really believe we are on the eve of great transformation in the dairy business. God speed the day when it may come and *long live the Grote*!

Hubbard, Or. M. S. SHROCK.

Losses in Manure Value.

In 1899-1901, three series of steer feeding experiments were made, comparing the gains obtained from animals kept without tying in a box stall, and from those tied as usual in the ordinary stalls, the former being watered in the stall, the latter turned out daily to water. The results, reported in Bulletins 53 and 57, show that by the former method a very large saving in cost of attendance is secured, without any decrease in the gain of live weight, or any disadvantage as respects the quantity of food required to produce it. The relative economy of the two methods is, however, not fully demonstrated until the value of the resultant manures is known; for these differ materially in the conditions of their preservation. The manure from the box stall was formed upon a cement floor, and was kept under the animals, compacted by their trampling, until the close of the experiment; that from the animals tied in the stalls and watered in the barnyard was, on the contrary, daily removed and stored in a compact heap under conditions closely approximating those of a covered manure shed, except that it was not subject to trampling by the stock.

The fertilizing constituents in food and litter, less those used in forming new animal tissue, were compared with those recovered in the two manures. The comparison is especially interesting, because of the increasing use of the covered shed method in Pennsylvania.

First—The trampled manure, suffered little loss of fertilizing constituents, though less than two-fifths of the dry matter of food and litter was recovered in the manure.

Second—The covered shed manure lost one-third of its nitrogen, one-fifth of its potash and one-seventh of its phosphoric acid. Only one-third of the dry matter of food and litter was recovered in the manure. The potash and phosphoric acid losses must be explained by seepage of liquid manure into the clay floor. The loss of nitrogen is, however, chiefly due to volatilization of carbonate of ammonia.

Third—The money value of the fertilizer constituents lost by the second as compared with the first method is equivalent to $2.50 for each steer stabled for six months.

Fourth—Therefore, manure, if prepared upon a tight floor and with such proportion of litter that it can be trampled into a compact mass, loses very little, if any, of its fertilizer constituents, so long as the animals remain upon it. This method of preserving steer manure is, therefore, distinctly superior to that of the covered shed, though the latter method may not always exhibit as great loss as that observed in this experiment.—*Bulletin 63, Pa. Exp. Sta.*

A Stable Plan Considered.

ED. HOARD'S DAIRYMAN:—I have just begun a barn for my cows and wish some advice as to arrangement of interior. My main part is 48 ft. by 28 ft. I had planned it as follows, viz:

A feeding alley on either side, then platforms for cows and a central drive way. On the west end I have a lean-to for four horses with driveway connecting with cow barn driveway. Since planning the above I have been advised that instead of having driveway through the center, that by putting in manure carriers I could have room for two rows of cows and a row of calves, thereby gaining a nice place for calves.

Now would it be advisable to put in carriers instead of driveway? Any advice that you may give will be appreciated and I will look for the next issue of the DAIRYMAN with more interest than ever.

The ground floor on the east end will be some 12 inches above the ground while the west end will be about level with the ground on account of slope of ground which gives room for carriers to run out over wagon. I have planned to put my hay in barn with a hay fork from east end of barn. Could I arrange hay fork and manure carriers on same end?

Becker, Minn. J. C. WAGNER.

We suppose the dimensions given above represent the extreme width and length of the outside. If so, one must deduct at least one foot and possibly more in order to arrive at the available interior width. After doing this, we do not see how it would be possible, even by dispensing with the driveway and substituting a litter carrier, to find room for a row of calves. More than this, we do not think it desirable to do away with the central driveway, even though litter carriers might be used, as there is nothing gained by over-crowding.

The only way in which arrangements for using a litter carrier could be made without interfering with unloading hay, as suggested, would be to have a section of the track for the litter carrier made removable. It would not be a very difficult undertaking to do this.

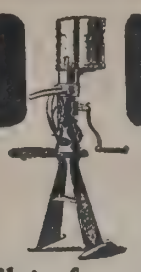
A NEW ROUTE.

The Road to Wellville.

It is by change of diet that one can get fairly on the road to health after years of sickness, for most ill health comes from improper feeding.

What a boon it is too shake off coffee sicknes and nervouss headaches as some can if determined upon.

One woman accomplished it in this way: "A few years ago I suffered terribly from sick and nervous headaches being frequently confined to my bed two or three days at a time the attacks coming on from one to four times in every month. I tried medicines of all kinds, but could get no real relief until my parents finally persuaded me to quit the use of coffee altogether and try Postum Food Coffee. It had come to a point where I was so utterly miserable that I was willing to make any reasonable trial.



A person couldn't believe what followed but the results speak for themselves; that was two and a half years ago and I have never tasted coffee since I use Postum not only for its delicious flavor but more for the good it has done me. All of my troubles disappeared as if by magic and I have for the past two years been doing all the work for my family of six. I seldom have even a slight headache and I would not give up my Postum and go back to coffee now unless I deliberately intended to commit suicide.

"All my neighbors it seems to me now use Postum in place of coffee and some of them have been doing so for several years with splendid results from the health point of view." Name given by Postum Co., Battle Creek, Mich.

Eight Years Fifteen Cows

The Empire Way Makes Cows Pay.

1895 1896 1897 1898 1899 1900 1901 1902

How's This for a Record?

Emporia, Kans., Jan. 2nd, 1903.

Empire Cream Separator Co., Bloomfield, N. J.

Dear Sirs: Have used one of your **Empire** Cream Separators for the past eight years, during which time I have been milking at all times from twelve to fifteen cows. The cost for repairs in the eight years has been only seventy-five cents. I have had experience with other separators but consider the **Empire** superior to any other, as it never caused me any bother. It is easy to clean and has proven very durable. It does good work at all times. L. H. VAHSHOLTZ, Rural Route No. 4.

The Empire Cream Separator turns more easily, is more easily cleaned, does better work, and costs less for repairs than any other, because it is the **simplest separator made.** Don't buy a separator until you have investigated the merits of the Empire.

Frosted Corn for the Silo.

ED. HOARD'S DAIRYMAN:—In all my replies to inquiries regarding the corn situation, I have told the silo men to have every thing ready so as to cut the corn the morning it is cut with the frost, providing it is not ripe enough before: it will be better so than cut immature before frost. I found corn in this locality last week that is now in good condition for the silo. It was planted May 7th. BUFF JERSEY.

Monmouth, Ill.

Oats and Peas for Silage.

On my farm at Forestville this county we have filled a fifty ton silo with oats and peas. What do you know of such silage? Will it keep well and prove good feed? We cut it in direct from the mower and had three men tramping in the silo. It was put up in first-class order, being at the proper stage, I think. During the noon hour it got wilted a little so we ran water on it as it went up the carrier.

Corn in this county is very small, being late in planting, and it looks very doubtful about farmers getting enough to fill their silos. E. J. S.

Chautauqua Co., N. Y.

We are without personal experience with peas and oats for silage, but a great many readers of the DAIRYMAN have reported such experience, and so far as we now recall this form of silage has given universal satisfaction.

Guernsey Breeders Will Meet at Wisconsin State Fair.

ED. HOARD'S DAIRYMAN:—As has been our custom for three or four years the Guernsey breeders will have supper together, on the State Fair grounds at Milwaukee, Tuesday evening, September 8th, and after supper will informally discuss the Guernseys judged during the day.

It is expected that the judge, Mr. H. C. Taylor, will give us his impressions of them.

We hope as many as possible will plan to attend. CHAS. L. HILL.

Rosendale, Wis.

DAIRY MARKETS.

Herman Bldg. Milwaukee, Wis.

The Best Cow

you ever owned would be a better cow both in general condition and milk yield if fed a regular ration of

Alma Dried-Molasses Beet-Pulp

When pasture is insufficient or altogether lacking this Food supplies just the needed elements to maintain the maximum yield of milk. It is better than bran and costs less.

Let us send you our printed matter which tells how careful we are to have it proportioned just right and absolutely clean. See, too, what others think about it.

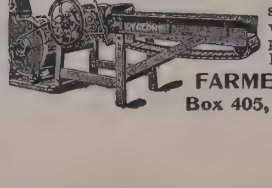
Alma Dried-Molasses Beet-Pulp is unlike many patent "stock-foods." It is a natural product and contains no drugs or other injurious ingredients.

Sanitary Milk Co., Grand Rapids, Mich., writes: "Send a second carload. We find it as a milk producer better than bran."

If you are feeding stock for the market you will find **Alma Dried-Molasses Beet-Pulp** fed with grain the best fattener, because it increases the appetite, aids digestion and assimilation.

Do not confuse this with wet beet pulp which freezes and ferments, or with common dried pulp containing no additional sugar. It takes 16 tons of wet pulp to make one ton of our Food and it keeps indefinitely. The genuine Alma Dried Molasses Beet Pulp contains 72 times as much sugar as wet pulp, and nearly 5 times as much as common dried pulp.

Write to-day for prices, directions for feeding, analysis by U. S. Government expert, etc. Address



Dept. 6, Alma Sugar Company.
Alma, Michigan.

Gas Engine Excellence

is best represented in the **Buick** Engines---the reason why we make more small engines than any other manufacturer. Are you thinking about an engine to do the cream separating, churning, pumping, feed cutting or other farm work? Do you want guaranteed workmanship and up-to-date construction! If so, it's going to pay you to get our catalog H before buying.

Does Saving **ONE or TWO MEN**

at the cutter mean anything in ensilage cutting time? **Self Feed** on "Ohio" cutters does that and more, and increases capacity 33⅓ %.

1903 "OHIO" BLOWER ELEVATORS

solve the Blower problem. They successfully elevate ensilage into silos to any height, as demonstrated by abundant proof in 1903 catalogue. 10 and 12 H. P. Engines drive Nos. 13, 16, 18 and 19 Cutters with blowers, and all other sizes "Ohio" Ensilage Cutters. In capacity "Ohio" Cutters lead; 10 to 30 tons per hour. **1903 Shredder Blades**, patent applied for, are interchangeable with knives, all sizes. They put corn stalks into best condition for feed, running at normal speed.

Our absolute guarantee goes with every machine. Made by

The Silver Mfg. Co., Salem, Ohio.

FOND DU LAC, Wis., Aug. 31—Cheese—Sales at Dairy Board today were 359 Twins at 9⅝c; 452 Daisies, at 10⅝c; 80 at 10⅝c. Market active.

HORTONVILLE, Wis., Aug. 20.—Cheese—The offerings were 78 Cheddars, 1,300 Twins and 66 double Daisies. Sales were as follows, less than half the Twins being sold: 78 Cheddars at 10c; 66 double Daisies at 10¼c, 454 Twins at 10c; 173 at 9⅞c. Market moderate.

NEW YORK, Aug. 31—Butter—Receipts, 9,433 pkgs.; market firm; state dairy, 14@18c; extra creamery, 19¾c; Packing stock, 12@14½c; creamery common to choice, 18@19½c.

Eggs—Receipts, 10,316 pkgs.; market firm; state and Pennsylvania, fancy mixed, 23c; state and Pennsylvania, seconds to firsts, 19@21c; refreigerated 17½@19c; western, seconds to firsts, 18@21c.

Cheese—Receipts, 4,321 pkgs; market quiet; state full cream, fancy, small colored, 10¼c; small white 10¼c; large colored 10c; large white 9¾c.

WATERTOWN, N. Y., Aug. 31—Cheese—Sales 8,000; 9⅝@9⅞c for large ;10c for small sizes.

CANTON, N. Y., Aug. 31—Cheese — Offered 2,180 boxes Twin cheese and 1,292 tubs of butter. Cheese sold at 10c; butter 20c.

UTICA, N. Y., Aug. 31—Cheese—Sales: 6,500 boxes large colored, 1,800 white, 9⅞c; 3,500 small, 10⅛c; market unchanged.

NEW YORK MARKET.

NEW YORK, Aug. 29—Butter—Receipts for the week, 51,932 packages.

Exports for the week, 400 packages.

Notwithstanding the official quotation was lowered a quarter of a cent a pound on Monday, trade was good all the week, and sales were readily made of extra creamery at the old quotation, twenty cents, and this style butter is in light offering and firm at the close. Best firsts found plenty of buyers at 19@19½c, and under grades of creamery had better inquiry at 16@18c.

New York State Dairy in very light supply; fancy quality, sold at 18@19¼c, and odds ends of poor to good grades cleaned up at 15 to 17c.

Creamery, extra, 20c; medium, 19@19½c; poor, 15@18c; Dairy, extra, 18@19c; medium, 15@17c; poor, 14@15c.

Cheese—Receipts for the week, 40,644 boxes. Exports, 3,635 boxes..

The market was less active this week and price slower and always in buyers' favor. Full creams, both large and small, sold at 10¼@10½c. Skimmed cheese were hard to dispose of unless of very finest quality, and some poor to good stock was carried over unsold. We quote:

Full Cream, extra, 10½c; medium, 10@10¼c; poor, 8@9¼c.

Eggs—Receipts for the week, 44,710 cases.

Continued light receipts and a steady active demand caused a farther advance in price, and an absolute scarcity of strictly fancy eggs at the close. We quote:

New York & Penn., strictly fresh, per dozen, 23@24c; Northern & Western, strictly fresh, 21@22c; all Sections, poor to good, 16@20c.

177 Chambers St. DAVID W. LEWIS & Co.

NEW ORLEANS, La., Aug 31—Butter—Receipts liberal; demand fair; extras, 20c; firsts, 19c.

Eggs—19c.

TOPEKA, Kan., Aug. 29—Butter—Creamery butter 19@21c; dairy, 17@18c.

Cheese—Longhorns, 11c; Twins 10¾c; Singles, 11c; Prints, 11½c.

WASHINGTON, D. C., Aug. 31—Butter—Market firm. Extras 20¼c; Fancy firsts 19½c; renovated, 17c.

PHILADELPHIA, Pa., Aug. 31—Butter—Market firm Solids 20c; nearby prints 21c; western 20c.

NEWARK, N. J., Aug. 31—Butter — Market steady at 19¾.

Eggs—Extras 22c; firsts, 21c firm.

BOSTON, Mass. Aug, 31—Butter—Creamery western extra, 20@20¾c; western firsts, 19c; dairy, 15@19c; imitation creamery, 15@15½c; ladle, 13½@15c; box and print, 15@21½c.

Cheese—Choice, 9½@10½c; Wisconsin Twins, 9½@10½c; Ohio flat, 9@9¼c.

Eggs—Nearby, 28c; western selected, 20@22c; poor to fair, 16@17c; Illinois, 18c@19c.

BALTIMORE MARKET.

BALTIMORE, Md., August 27—Butter—There has been no material change in the situation during the past week. The reports from the dairy sections are that the supplies of milk and cream owing to the prevailing hot weather are gradually getting lighter. Such being the case, we may look for a continued decrease in the receipts of extras from this time on. The quality of the stock arriving, while not up to the standard, in many instances is about as good as one could expect under the existing weather conditions. The demand which is almost exclusively for consumptive purposes continues fairly good, all things being considered. Imitation creamery and ladles are in ample supply for the requirements. Packing stock is in moderate receipt, while the demand is quite good, especially for desirable stock. Blocks and prints—The supply is about equal to the demand. At the close of to-day's market, although the feeling in general was about steady, there was a conspicuous absence of any signs of activity.

Creamery Separator, extras, 20@20½c; firsts, 18½@19½c; seconds, 16@18c. Imitation Creamery, extras, 18c; firsts, 17c; seconds, 14@16c. Creamery blocks (2-lb.) extras, 21@22c; firsts, 20c; seconds, 17@18c. Creamery prints (½ lb) extras, 22@23c; firsts, 21c; seconds, 17@19c. Md. Va., & Penn. Prints, extras, 20@21c: firsts, 19c; seconds, 16@18c.

Eggs—A very firm feeling has prevailed since our last issue, and prices have been further advanced owing to continued light receipts of desirable stock and a very active demand, hence the market is kept quite bare of all good to choice offerings. At the close of the market to-day, the situation was firm and healthy at 22 cents.

Cheese—The receipts ample; demand moderate; market unsettled: and lower prices are looked for in the near future.

N. Y. State—Cheddars, fine, 10¾@11c; choice, 10¼@10½c; fair, 9@9½c, Flats, fine, 10¾@11c; choice, 10¼@10½c; fair, 9@9½c; Small, fine, 11@11¼c; choice, 10½@10¾c: fair, 9½@10c; Ohio Flats, fine, 9¾@10c; choice, 9@9¼c; fair, 8¼@8½c; O. Picnic, fine, 10@10¼c; choice, 9½@9¾c; fair, 8½@9c; Swiss Cheese, (domestic) new, fine, 13@13¼c; choice, 11@12c; fair, 9@10c.

Address DAIRY, Box 244, Northport, Wash. 29-2

A Good Pointer on CREAM SEPARATORS

From the "Nebraska Dairyman" Lincoln, Neb.

A Valuable Token of Esteem from a Son to Father and Mother and a Display of Good Judgment.

Our friend, J. M. Betts of Broken Bow, Neb., sends us the following:—

"Our esteemed citizen, Frank Norton, and his wife are the recipients of a very fine present from their son Frank Lee Norton, of Racine, Wis., who is manager of the J. I. CASE THRESHING MACHINE COMPANY. The father and mother being extensive farmers and have many milch cows, wrote the son that 'as all the neighbors were getting cream separators, they thought that they, to be in line with them, should purchase one. The son, on receipt of the letter, immediately purchased a DE LAVAL SEPARATOR and shipped it to them, writing to them as follows: 'My Dear Father and Mother: I have examined the different makes of cream separators and send you the one that I consider the very best; it costs a little more than some others, but the difference in price is more than made up in quality.' "

A De Laval Catalogue may be had for the asking.

Economy in Production.

ED. HOARD'S DAIRYMAN:—What is the most economical way to make milk, butter and beef? This is one of the greatest economical questions that today faces the farmer.

One of the important lines of activity of fifty-four Agricultural Experiment Stations which are supported in the United States by national and state funds, is that of experiments upon the economical feeding of live stock. These experiments range all the way from simple trials of different feeds to elaborate physiological studies of the fundamental principles of nutrition.

Prominent among investigations in the latter class are those now in progress at the Pennsylvania Station, located at State College, Pa., where the most extensive and elaborate apparatus in existence for this purpose has recently been completed. This apparatus is called by the double name of Respiration-Calorimeter, to indicate its double function. Its construction was begun in 1898 by the Director of the Station, Dr. H. P. Armsby, and his associate, Mr. J. A. Fries, with the co-operation of the Bureau of Animal Industry of the United States Department of Agriculture, and a full scientific account of the first series of experiments is now in the printer's hands. The apparatus is identical in principle with the one originated by Profs. Atwater and Rosa, of Wesleyan University, at Middletown, Ct., for experiments on men, having been modified in details and enlarged so as to permit of experiments on cattle. The construction and testing of the apparatus occupied nearly three years. It is housed in a special building, and the total cost of apparatus and building was fully $15,000.

As its name indicates, it is at once a respiration apparatus, by means of which the amounts of the various gases given off by the animal can be determined, and a calorimeter to measure the heat produc- in the body. Its essential part is a double-walled chamber, about six by ten feet, and eight feet high, containing a comfortable stall for the animal. The walls of this chamber are double, the inner one being of sheet copper and the outer one of zinc, with an air space between. The door through which the animal enters and the smaller one through which feed is given it, close air-tight, shutting off the animal entirely from the world outside except as he can see it through the double plate glass window.

During an experiment, a ventilating current of pure, dry air at a uniform temperature is drawn through the chamber by an apparatus called a meter-pump, specially designed and built for this purpose by Mr. Frederick Hart, of Poughkeepsie, N. Y. The meter-pump not only pumps the air, but measures it and automatically takes two duplicate samples for analysis. The air as it enters is likewise sampled by another apparatus, and all these samples are analyzed. By comparing the results it is easy to tell what the animal in the chamber has added to the air, and thus to weigh his breath even more exactly than Sir Walter Raleigh did the smoke from his pipe in his famous wager with Queen Elizabeth.

The "copper box" in which the animal stands is surrounded by two wooden boxes, each box being eight inches larger than the one inside it. There is thus a four-inch air space all around the inner, metallic chamber and another one between the inner and outer wooden casings. By means of complicated electrical devices, the temperature of these air spaces can be regulated with the utmost nicety. When in use, they are kept at exactly the same temperature as the air inside the inner, metallic chamber where the animal is, the temperature of the chamber being measured by delicate electrical thermometers. As a result, none of the heat which the animal gives off can escape through the walls of the chamber, and by a similar adjustment the air is made to enter and leave the chamber at the same temperature, and so carry off no heat.

If this were all, the interior of the chamber would soon become unbearably hot. To prevent this, cold water is circulated through copper pipes to take up the heat, the action being just the reverse of that of a hot water radiator. By proper adjustment of the current the temperature of the chamber may be kept so nearly the same that a variation of as much as one-thirtieth of a degree Fahrenheit is exceptional. In this way, all the heat is, so to speak, concentrated in the water. The temperature of this water as it enters and leaves the copper pipes is taken every four minutes with thermometers reading to one-fiftieth of a degree. The difference shows how much it has been warmed by the heat it has taken up, and this multiplied by the weight of the water passing through the cooling pipes gives the total quantity of heat produced.

The animal is usually put into the Calorimeter between one and two o'clock in the afternoon. The next few hours are occupied in the final adjuttment of the apparatus and at exactly six o'clock to the second, the experiment is begun and continues without interruption for forty-eight hours. During this time there are never less than three men on duty and at times seven and eight. When it is considered that in addition all the various samples of feed and excreta have to be analyzed by the chemists of the Station, and that observations taken every four minutes through several forty-eight hour experiments, yield almost literally "acres of figures" for the computer, some idea can be had of the amount of labor which must be expended in such investigations.

The general idea of the experiments is to study the food as the fuel of the animal body, supplying energy to drive the vital machinery, somewhat as the coal supplies energy to drive the locomotive.

A weighed sample of the food in question is first burned completely in oxygen under a pressure of about 300 pounds to the square inch, in a small bomb of gun-steel known as a bomb-calorimeter, and the heat produced is accurately measured. This gives the total fuel value of the food. As the food is used in the body, however, a considerable part of it is not burned completely and this, of course, cuts down its value to the animal. Part of these unburned or partially burned products are contained in the visible excreta. Another important part is found in the combustible gases which are given off by cattle and which are determined in the experiments with the respiration-calorimeter. It has been commonly assumed that practically only one such gas is excreted, viz., marsh gas. In the first series of experiments with the respiration-calorimeter, the

"ADVERTISEMENT."

THE VALUE OF CHARCOAL

Few People Know How Useful It is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

CONSUMERS should bear in mind that there are many brands of White Lead (so called) which are claimed to be "just as good" or better than Pure White Lead, which contain little, if any, White Lead, but are simply mixtures of Zinc, Whiting and Barytes, or other cheap, inferior materials.

Make sure that the brand is right. Those named in list are genuine.

If interested in paint or painting, address

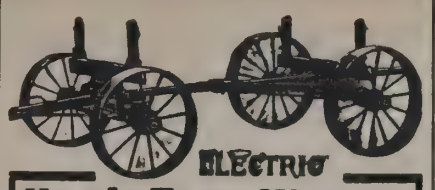
ratio of hydrogen to carbon in these gases was determined. The theoretical ratio for pure marsh gas is 1: 2.976. The average of fifteen experiments gave the ratio of 1: 2.983, or practically the theoretical figure, thus furnishing the first direct proof of the correctness of the assumption.

After taking account of the unburned products of the food, it would seem that the remainder would represent its value as fuel for the organism, and this has quite generally been assumed to be the case, just as, after deducting the waste in ashes and flue gases we have the fuel value of the coal burned under the boiler of a locomotive. One of the objects of the first experiments made with the new apparatus was to test this current view (the so-called law of isodynamic replacement), which has the backing of some eminent authorities. The results showed that it at least requires very material modification.

Of the total fuel value of a sample of hay (after first deducting the unburned wastes) only 63 per cent, was found to be of direct use to the animal. This was gotten at by first feeding a very light ration and finding how much heat the animal produced by burning up its own flesh and fat. This amounted to 2578 Calories. (A Calorie is the amount of heat required to warm 1 Kilogram—2.2 lbs—of water 1 deg. Centigrade.) Then a weighed amount of hay was added to the ration. Its fuel value, after taking into account all unburned wastes, was 2840 Calories. If the food was simply the fuel of the body, this should have saved the burning of an equivalent amount of the tissues of the animal. But instead of this it effected a saving of only 1787 Calories, or about 63 per cent.

The rest of the fuel value of the food, represents the energy that had to be expended on the hay in preparing its ingredients for use in the body, that is, the work of digestion and assimilation. It is what it costs to put the coal under the boiler, and while a necessary expenditure, the energy which it costs, could not be used for the other purposes of the body but escape as heat, and since the animal already had enough heat to keep him warm, it was simply gotten rid of as quickly as possble.

Experiments are being made upon other feeding stuffs to tests their behavior in this respect, with the expectation that important differences will be shown between different feeds. At present, the only available basis for comparing such feeds, is their digestibility, or in some cases their fuel value. There is no doubt, however. that the different feeds require very different amounts of energy for their digestion, and that consequently equal amounts of digestible matter, or equal fuel values, may have very different nutritive values. It is the purpose of these investigations to trace out these differences and to substitute accurate determinations of the real nutritive value for approximate and more or less erroneous figures now available. Like all fundamental work, it is slow and laborious, but if successful, it lays the foundations for a more economical, because more intelligent, production of beef, mutton, pork, milk, butter, etc. C. L. GATES.



Bellefonte, Pa.

Cost of Pasteurizing.

Experiments conducted at the Royal Experiment Station in Copenhagen prove that if a pasteurizer is properly constructed and properly operated it will require about 90 lbs. of steam for heating 1,000 pounds of milk, from 90 to 185 degrees F., says M. Mortenson. If we figure that it takes one pound of coal to produce four pounds of steam, to produce ninety pounds of steam will then require 23 pounds of coal. Figuring coal at $4 per ton and our butter yield 4½ pounds butter to 100 pounds milk, makes the cost of pasteurizing one pound of butter about one-tenth of a cent. This expense, however, is reduced considerably by pasteurizing the cream and skimmed milk separately. The cream is reduced to such a small amount that the expense per pound will be very little. For pasteurization of skimmed milk the exhaust steam can be used; this is also more satisfactory to the patrons, as milk when pasteurized after skimming is warm enough to scald the cans and the milk keeps sweet longer.

ELECTRIC

Handy Farm Wagons

make the work easier for both the man and team. The tires being wide they do not cut into the ground; the labor of loading is reduced many times, because of the short lift. They are equipped with our famous Electric Steel Wheels, either straight or stagger spokes. Wheels any height from 24 to 60 inches. White hickory axles, steel hounds. Guaranteed to carry 4000 lbs. When Shall Corn be Harvested for Silage?

A very serious and unusual problem confronts the dairymen in many sections of the country this season. The corn crop is very late and it is almost certain that many fields will not mature before frost comes. In this immediate vicinity, except on the very lowest ground, corn has made a fair growth of stalk, and in some places, the ears are fairly well developed, but they are yet from two weeks to twenty days behind the usual time for ripening, and a killing frost, almost any time now, would not be unusual. The question, therefore, which confronts us is, shall we cut this corn into the silo before it has properly matured, so as to escape frost, or shall we delay, hoping that a change in the weather may bring the corn to maturity. So far as the editors of this paper are concerned, they will prefer to let the corn be frosted rather than cut it into the silo before it is properly matured. It has been, as we believe, fully demonstrated that frosted corn may be made into good silage. We should endeavor to cut the corn as soon after the killing frost comes as possible, and if we could not put it all into the silo immediately, shock it up in the field and draw it to the silo when convenient.

In this connection, we republish a communication from Mr. J. G. Reine of Vernon County, Wisconsin, originally published on page 62, April 24th of the present year.

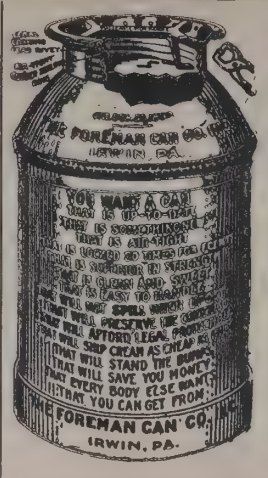
GOOD SILAGE FROM FROSTED AND DRY CORN—HOW IT WAS DONE.

ED. HOARD'S DAIRYMAN:—I put up a Kalamazoo silo, 16x27, last season, but didn't get it completed so as to fill it before the frost cut the corn. I had to cut and shock the corn in order to save the feed. Well, my power didn't get here in time, so the corn set in the field six weeks before I got to filling. I finished about the fifth day of November, and I have splendid silage. The cows don't leave a bit of it. There was some spoiled at the doors.

The way I filled was this: We had our cutter, which was a No. 3 Belle City with a 35-feet carrier, and run it with a 5 H. P. Weber gasoline engine. The cutter set up on a platform just the height of the rack on trucks; then I took a large oil barrel and set it on a bench by the side of cutter, put a nipple in the barrel with faucet and a nozzle of a sprinkling pot on the end of it; then I used a long rubber hose and connected it on the pipe at the water tank, then set the wind mill to pumping and that kept the barrel full of water. Then when we were cutting we would open the faucet and let water in the barrel. This wet it in good shape. My neighbors all said I was crazy and that it would all spoil and I would have lots of manure to haul out, but, to their surprise, I have got good feed.

Vernon Co., Wis. J. G. Reine.

This communication, as will be seen, is not only direct testimony as to the practicability of putting frosted corn into the silo in expectation that good silage will result, but it is fully as explicit in its description of the manner of handling the corn, so as to produce good silage.



Musty Oats—Aborting Cows—Barley and Wheat Straw.

ED. HOARD'S DAIRYMAN:—I have 400 to 500 bushels of oats similar to sample enclosed, which heated in the bin. I cannot sell them and propose feeding, (of course chopped), to dairy stock. Do you think this unwise? It is with me the only way to use them. I have no pigs to feed them to and cannot get any.

2. Cow 9 years old, slipped calf in pasture 4 weeks ago; first case in herd; no known reason; 7 months gone in calf; isolated her at once in small paddock. She frets very much at being alone. Will it now be safe to let her go with the rest of cows again? Still, at intervals a slight discharge of matter. Want to fatten her off for beef, but can do nothing while she frets.

3. Pure bred Shorthorn cow; 5 years old; running to pasture all summer; calved in Feb., rather fat; bulling and served every three weeks since. What treatment do you recommend?

4. Shall have a rather large quantity of wheat and barley straw next winter.

We wish to announce that we are now operating our new factory at Irwin, Pa. Capacity—1000 cans daily, which should enable us to fill all orders promptly.

Which is the least valuable to use for bedding for cows and horses?

Red Deer, Alberta. C. A. J. S.

1. The sample of oats received, while decidedly "musty," is not so seriously injured, in our opinion, as to make the feeding of this grain seriously objectionable. Moreover, a thorough winnowing before grinding will probably remove a portion of this taint. After all, the only positive information must come from actual trial. If, after winnowing and grinding, the oat chop appears to be objectionable, try steaming or scalding with or in boiling water.

2. Disinfect the vagina daily, or as often as may be necessary to prevent the discharge, with a wash containing one part bi-chloride of mercury (corrosive sublimate) in five thousand parts of water (1 to 5,000), and wash the vulva and surrounding parts with same.

3. This may be a case similar to the foregoing, or it may be a matter of an acidy condition. Try some of the preparations advertised in the DAIRYMAN to overcome "failure to breed" or disinfect vagina with a solution of permanganate of potash—15 grains to quart of water.

4. Waving the objections to the barley beards, barley straw has a feeding value nearly 20 per cent greater than wheat straw.

CONCERNING OUR ADVERTISERS.

PASTURE ALL THE YEAR.

Every farmer, breeder and stock grower would like to have summer pasture for his stock the year around. A food that seems to very nearly equal fresh pasture is the Alma Dried-Molasses Beet Pulp which our readers will find advertised on another page of this issue. It has been thoroughly tested by leading dairymen, breeders and feeders of all kinds of stock. Write the manufacturer for full information. Address Dept. 6, Alma Sugar Co., Alma, Mich.

The advertisement of the Wisconsin Blue Grass Land Co., located at Baldwin, Wis., ought to interest, and seriously too, hundreds of the readers of HOARD'S DAIRYMAN. Their ad tells a good deal about the advantages of their lands and there is no question but what they have propositions to offer that will make money for those who accept. Northern Wisconsin has been for past few years, and is now, settling up very rapidly. There are no better farming lands any where than can be picked up here at low price per acre, and the market conditions are excellent. The price of these lands is bound to raise rapidly, and to-day there are hundreds of sections where land is worth from twenty-five dollars to seventy-five dollars per acre, when ten years ago it was sold around five dollars per acre. Any reader of HOARD'S DAIRYMAN who is not satisfied with his present location and would like to better his condition, is making a mistake not to investigate these lands that are advertised in the DAIRYMAN. There are several advertisements of same nature as one we refer to. They are worthy of more than the simply reading.

ONE-ARMED FARMERS.

This is no joke, for since the introduction of power machinery there are many farmers minus a hand or arm. But whether with only one arm or both, all farmers will be interested in the ad. of Toledo Plow Co., which appears elsewhere in this issue. These people are extensive manufacturers of all kinds of farm implements, but one of their specialties is cattle stanchions which they are selling at the present time on special delivered prices. These stanchions are made with a steel latch and can be easily operated with one hand. When the stanchion is open, it is locked securely so that as the cattle come in, there is no adjusting of the stanchion needed, and they can be closed with one hand. They swing freely and noiselessly with every movement of the head. Write these people to-day for free circulars and prices. Cold weather is coming and the barn should be made ready for winter's use. Address Toledo Plow Co., Dept. H, Toledo, Ohio.

A good word for the Milking Instrument advertised by Moore Bros., Albany, N. Y.:

COWS UDDERS SAVED.

Moore Bros. V. S., Albany, N. Y. Gentlemen—In regard to the Safety Milking Instrument will say that if it was in the hands of every dairyman or breeder, there would be thousands of cows udders saved each year that are now lost. I cannot recommend it too highly. Yours truly, HENRY STEVENS, Brookside Herd, Lacona, N. Y.

Every DAIRYMAN reader is interested in the ad. of M. G. Rankin & Co., Milwaukee, Wis., of Molasses Feed. These people are just placing this feed upon the market at a price, considering its feeding value, that makes it very attractive. Don't pass this by but look up the ad. Write them for information and price.

Spain's Churn

Hand made of thoroughly seasoned white cedar. Has large opening. Never gets water soaked or sours. Easy to clean. Simple to operate. A 30 years' test has proved it the best. Everything for the dairy or creamery—automatic milk scales, glass jars, butter workers, printers, shipping boxes, etc. Send for illustrated catalog of "Bestov" dairy supplies.

TRADE MARK BESTOV

DAIRYMEN'S SUPPLY CO., Dept. Philadelphia, Pa.

GEO. WENHAM, Fort Atkinson, Wis.

Care in the Keeping of Cream.

ED. HOARD'S DAIRYMAN:—This is a very important question and one that each and every cream patron should be interested in, for it will mean dollars and cents to the most careful farmer; for cream now should, and eventually will, sell on the market according to quality and grade, as any other farm product.

Cream even more so than milk will become sour and tainted if not cared for properly, and when in this condition it is utterly impossible for the butter maker to make first-class butter, and if each and every patron would observe a few general principles of care with their cream the grade of butter will be higher and of a better quality.

And now first of all, let us begin at the beginning:

First. The milking place. It should be clean and healthful, as well as all the milk utensils that are used. The best of care should be taken in cleaning and airing the separator, for it is like any other machine; it must be clean to do the best of work.

Second. After the milk is milked it should be removed from the stable or from about the cows, so that it will not collect the cowy odor which is in the air, and then before separating, it should be strained properly. The best strainer is a wire strainer with a band attached so that several thicknesses of muslin may be fastened beneath the gauze. The gauze will catch the largest of the filth, while the cloth will catch the smaller particles that have passed through the gauze, and, moreover, the better the straining the purer and sweeter will be the milk.

Third. Separate at once after straining as the milk is then in the best possible condition for separating. The skim milk will also be in the best condition for feeding purposes if the separating is done while the milk is still warm, for the milk then is as it would be if taken from the cow and given direct to the calf.

Fourth. And now comes the careful work of the farmer. He should strive to keep his cream in the best possible condition for a first grade of butter. Soon after separating, the cream should be cooled as quickly as possible, as bacteria grow and develop very rapidly at skimming temperature. The first cooling should be done in "shot gun" cans. These cans are about 24 inches in height and 8 inches in diameter. These tall cans tend to give a greater cooling surface than a much shorter and thicker would. The can of cream should be set in a tub of cold well water, and the cream stirred continually until cold. (Please don't go by guess as to whether the cream is cooled or not, when 25 cents will buy you a thermometer, and then you will know what you are doing). From the result of stirring, the cream will cool faster and will help to aerate it so that it may lose some of its bad odors. After it has become cooled in this way, lower it into a well with a cloth tied about the top of the can and keep it there until time to deliver.

Always keep the different separatings separate for at least eight hours. Then if the cream has been attended to properly, they may be mixed together without any very bad results.

Here is a caution that should be strictly attended to: "Never allow the warm cream to be mixed with the cold," for in so doing, the cream will become sour and tainted, and thus cause an inferior grade of butter.

You may ask if the cellar or cave is not a good place for cream. It is the general belief of all dairymen that cream should never be kept in the cellar, or caves. Nine out of ten cellars and caves have very peculiar odors, which are imparted to the cream, and cream thus affected can never be purified, thus making an inferior grade of butter.

To try the patience and nerves of a buttermaker send him cream that is contaminated with foreign odors, and see how quickly he will reject it.

Every farmer will find the well the best place for cooling and keeping his cream cool and sweet and free from odors. A properly constructed well with an arrangement for raising and lowering the cream cans is far superior to any refrigerator or ice box that is on the market. And also another thing to take into consideration is, that after you have the well once arranged there is no additional expense, while an ice box or a refrigerator must be supplied with ice every day.

And now, always remember it is very important that the farmer take the best possible care of his cream, that he may receive the best results for his work.

Fifth. Patron should have set days on which he is to deliver his cream at the station, and do it early in the morning, or as early as possible. When he takes the cream from its cooling place, it is then in the proper condition for hauling, therefore, to keep it in that condition, a heavy, wet blanket should be placed over the cans, and then over the wet blanket, a dry or waterproof covering should be placed. This course will not permit any evaporation, and the cream will then reach the station in a fine, cool sweet, condition.

Patrons will find it more profitable to get their cream to the station in as sweet a condition as possible. The more sour the cream, the more acid has developed in same, and the acid makes it hard to get an accurate test of the cream.

Cream in such conditions is hard for the buttermaker to handle and he cannot get the proper results therefrom.

In the case the patron ships his cream, he should get his cans of cream to the depot in as cold a condition and as near train time as possible, and never ship where cream will have to stand at the depot over a night or a day, or where same will have to be in transit a day, or over night.

KEEP WELL IN MIND THESE POINTS.

Keep every thing used in the handling of milk and cream clean, well washed, scalded and aired for purification.

Milk rapidly, strain well, and at once separate the milk, and cool the cream without delay, and strictly keep same separate for six or twelve hours in a well, adapted for the purpose.

Never put cream in the cellar or cave, where there is any foreign odor or smell.

Never mix warm fresh cream with the already cooled cream.

Never put a tight cover on cream, except when necessary for delivering of the same.

Always keep a cloth tied over the cans when cooling, as this will keep the air from the cream and will keep the flies and other foreign particles out.

In the summer months put a wet blanket over cans, and a dry one over the wet one; this prevents radiation of heat.

Carefully follow the above points, and

A Woman's Prayer

It is notable that in the despondency caused by womanly diseases, there seems to many a suffering woman no way of escape from pain except at the price of life itself. It would be sad to record such a story of struggle and suffering except for the fact that in such dire distress many a woman has found a way back to health and happiness by the use of Dr. Pierce's Favorite Prescription. The one and only remedy for leucorrhea, female weakness, prolapsus, or falling of the womb, so absolutely specific and sure in curing these common ailments of women, as to warrant its makers in offering to pay, as they hereby do, the sum of $500 reward for a case of the above maladies which they cannot cure.

"Your medicine almost raised me from the dead," writes Mrs. Edwin H. Gardner, of Egypt, Plymouth Co., Mass., Box 14. "My urine was like brick dust, and I had pain all over me, and such a dragging feeling it seemed I could not do my house work. One day I found a little book. I read it and wrote to Dr. Pierce, and in a few days received an answer. I decided to try his medicine, and to-day I am a well woman. I have no backache, no headache, no pain at all. I used always to have headaches previously to the monthly period and such pain that I would roll on the floor in agony. I took three bottles of Dr. Pierce's Favorite Prescription and three of 'Golden Medical Discovery' and three vials of Dr. Pierce's Pleasant Pellets, and was completely cured."

Accept no substitute for "Favorite Prescription." There is nothing just as good.

Dr. Pierce's Common Sense Medical Adviser—sent *free* on receipt of stamps to cover expense of mailing *only*. Send 21 one-cent stamps for the book in paper covers; or 31 stamps for the cloth bound volume. Address Dr. R. V. Pierce, Buffalo, N. Y.

From Cow To Cream

is but a short journey on the farm that runs the

AMERICAN Cream Separator,

the one that gets the profits, and runs without an expert. We let you test it yourself and return if it is not a money maker for you. The price makes it easy to buy. Write now for free catalogue.

American Separator Co., Box 1028 Bainbridge, N. Y.

Awarded Medal at Paris Exposition.

THE Iowa Dairy Separator.

AN UP-TO-DATE MACHINE REPLETE WITH PRACTICAL IDEAS

It is built in the following sizes:

250, 350, 450, 600, 750 POUNDS PER HOUR

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

SEND FOR CATALOGUE NO. 60 AND PRINTED MATTER.

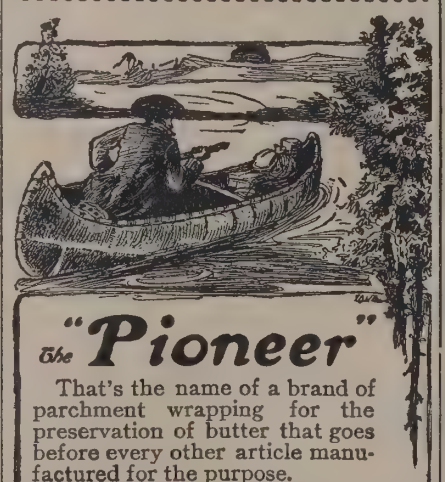
IOWA DAIRY SEPARATOR COMPANY, WATERLOO, IOWA.

WANTED!!

Every reader of this paper who owns a few cows to send for our new catalog of

DAVIS Cream Separators

Sent free upon request. It will tell you why the Davis Separators are money makers for their owners.



THEY ARE GUARANTEED to separate THOROUGHLY and QUICKLY. Dairymen and farmers find the "Davis" the most economical piece of machinery on the farm. Let us send you full particulars about it

DAVIS CREAM SEPARATOR CO.
54 to 64 N. Clinton St., Chicago.

NEW OXFORD BALL BEARING Cream Separator

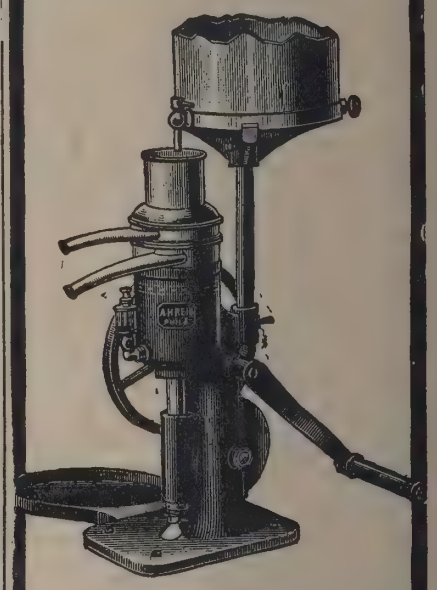
Sold on guarantee to be the best on the market. Catalog free.

WORLD CREAM SEPARATOR CO. 41 Main St., Council Bluffs Ia.

The "Pioneer"

That's the name of a brand of parchment wrapping for the preservation of butter that goes before every other article manufactured for the purpose.

Pioneer Brand Parchment Paper



keeps the delicate flavors in and prevents butter from absorbing the foreign odors it meets in commission house, cellar and shop. Has no taste or smell to impart—pure vegetable parchment, tougher wet than dry.

Don't Mistake the Brand.

There are papers made in imitation. The *"Pioneer"* is the original wrapping which put the cotton or linen cloth out of business. It differs from so-called parchments in that it is a vegetable product instead of rags and paper. Sheets for print wrapping, box and tub lining. Name or brand on sheets when desired. Write for free samples and interesting book, "Better Butter."

The Paterson Parchment Paper Company,
37 Eighth St., Passaic, N. J.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

Pennsylvania Pickings.

Doctors Disagree — Poor Cows — Making Beef.

ED. HOARD'S DAIRYMAN:—Our Doctor Wiley, of the Agricultural Department at Washington, is reported to have said in relation to using injurious preservatives in food products. "There may be occasions of emergency or exigency by which the use of a chemical preservative is rendered imperative. The short period over which such an emergency would extend would not seriously endanger the health of the consumer were he to eat food for a brief period containing any one of the principal preservatives in common use."

That strikes me, a layman, as rather a remarkable statement to come from an authority who is supposed to be also somewhat a guardian of the public health. Usually the fellow who injects the preserving poison into the beef or pork or lamb, or adds it to canned corn, peas or mushrooms has no notion nor care whether his product will be eaten to-morrow or next month, and unless the poison gathers virulence by age, it is difficult to understand how the earlier or later taking of it will make much difference.

Dr. John Marshall, of the University of Pennsylvania, says:

"Salicylic acid not only produces indigestion, but dyspepsia, rheumatism and other ailments result therefrom. There is no doubt that some of these preservatives are accountable for a great deal of illness and the law prohibiting their use should be rigidly enforced. I felt the evil effects of salicylic and boracic acid fully eight days after I had taken them. If that is the case of the one special test I made, what must be the result on the system of their constant use in these impure food products?"

POOR COWS.

We all seem agreed on the unfortunate evil of the poor cows in our dairy sections. They are accorded universal condemnation, but to my mind there are two fruitful sources that encourage or are responsible for their undiminishing numbers.

In many of our old established creamery neighborhoods, creameries are easily found that have never adopted the Babcock test in buying milk. What can be more encouraging to the keeping of any old thing of a cow so she gives a lot of milk? What encouragement is there for a dairyman to build up a rich milking herd of cows that pay more attention to quality than mere quantity, when his milk goes into the general pool and is paid for at an average where all the poor milk is counting against him?

It is a hard matter for a man so situated to grow away from his environment, so he sinks into it and his good cow aspirations are never developed. A pure bred dairy sire is generally as much out of place in such a community as a preacher at a political meeting.

It is strange to contemplate, too, that the unuse of the Babcock is almost always due to the prejudice of the dairymen themselves. This seems a parallel to the old farmers who didn't "want no winders in his stable—made it look so durned dirty."

Another probably more blameworthy cause of our poor cows, is the teaching of the advocate of the dual-purpose animal. The cow that makes a lot of butter and milk, that will raise a fine, big calf, and in due time go to the butcher, and make such choice cuts of beef that even her memory is a sweet savor— such an animal is very attractive to the farmer aud would be of immense value to him, if he could get her, but he never gets her and the no-purpose cows that result from the vain endeavor to produce the other kind, are living testimonials to the misleading teaching of misguided teachers.

MAKING BEEF.

Beef making is a different animal function, from butter making.

The cow that is an adept at the latter, is generally a failure at the former. I believe if one so wishes, he can carry on both the butter making and beef making on the one farm, but two seperate animals are needed. Where the two lines are conducted separately and intelligently, they can both be made to pay. There is not often any profit in uniting them.

There are many cases where a few steers fattening, would be a useful object lesson to the feeder of them and the cows. He might learn to feed the cows enough. I have heard many and many a steer feeder complain that his cattle were not eating enough. I have never heard a cow feeder say it. I have seen cows that could have said it if they could have talked.

Pa. W. F. MCSPARRAN.

Red Spots in Cheese.

HOARD'S DAIRYMAN:—What is the cause of red spots coming on cheese, some in a few days after making and some not for two weeks? The shelves are kept clean and well scraped; cheese are full cream and not the least bit spotted inside, and fine flavor; do not use coloring; have had them get that way for three seasons, in the fore part of season. At first I thought it must be the shelves, but think not now, because I use canvas to cover the curd, and they get red and the stuff on them looks like coloring matter which I scrape off and leave the cloths white.

2. What is the effect of soda (put into milk to keep it sweet) on cheese? I believe some of my patrons are using it, but I do not know how to detect it.

Pa. SUBSCRIBER.

The cause of the red spots on cheese is due to the growth of a fungus belonging to the molds, which has the power of producing this red pigment. This fungus grows only on the surface of the cheese and therefore does not affect the inside. It however, discolors the exterior and may even stain the bandages to such an extent as to seriously impair the appearance of the cheese. The growth of this mold is naturally modified very much by the environment in which the germ is placed, and one of the conditions which is favorable for the growth of this fungus is a moderately warm temperature accompanied with a high degree of moisture in the air of the room.

These mold spores are more or less widely distributed and therefore if the moisture condition of the room is suitable for their growth they most always develop. Something can be done towards repressing them by washing the cheese in an antiseptic wash, such as a solution of boracic acid or a dilute solution of formaldehyde. It is better, however, to hold the trouble in abeyance by control of the moisture content of the curing rooms and if the rooms are well ventilated and not too high in humidity the conditions do not favor the development of these molds.

The addition of soda to milk is sometimes made to prevent the souring changes from occuring as rapidly as they would otherwise do. The addition of soda, however interferes with the action of the rennet in milk and it is therefore undesirable to have such substances in milk that is going to be used for cheese making or for any other purposes of dairy manufacture. There is no test that I know of that can be applied by the factory operator which will enable him to detect the very small quantities of this antiseptic. If sufficient quantity is added a distinct taste of lye is noted when the milk is tested, but this only occurs if a super-abundance of the antiseptic is employed. H. L. RUSSELL.

VETERINARY.

Queries in this department answered by Dr. A. H. Hartwig, Watertown, Wis.

Cow Pox.

A cow at first has hard lumps on inside of teats, which soon make the outside of the teat sore. When one teat seems to get better, sores will break out on other teats? J. H.
Delaware, Or.

ANSWER.

Your description answers to that of cow pox. Wash the parts clean after each milking, and milk the cows so affected last of all. When thoroughly cleansed with soap and water, dry and apply iodine ointment.

Swollen Udder.

Cow's bag has been very swollen at the last 3 calvings and it does not go away after 10 to 14 days as it does on other cows, but lasts for a long time after, making it very hard to milk her. It extends to the back of bag and between hind teats, it goes up about eight inches above teats and nearly forward to fore teats. The other part of bag is soft and nice, but back teats are also stiff, short, swelled and seems to hurt cow when she has to be milked. D. E. H.
Englewood, Ill.

ANSWER.

The swelling can be avoided somewhat if you milk your cow before calving, just enough to relieve her. You may also rub the udder with warm lard, rubbing it well with the flat of your hand; or you may use lanolin instead of lard. If after calving, the swelling appears in spite of the above treatment, you may continue the external treatment and give the following internally: Fluid extract of poke root, ½ ounce; acetate of potash, 2 ounces; water enough to make a quart. Give this dose twice daily until swelling disappears.

Holding Up Her Milk.

Have a valuable cow that began last year to hold up her milk. No reason can be assigned; in good condition. J. McC.
Snohomish, Wash.

ANSWER.

There is no medical treatment for such a case, if the cow is in good condition as you state. The nutrition is likly going into fat. The only remedy would be to keep on milking, and rubbing the udder with the flat of the hand to induce the udder to become more active.

[The office editors suggest that a trial be made in this case of giving the cow something good to eat just as you commence milking. This will tend to pacify the cow, and do away with the nervousness that results in the suppression of the milk.]

Verminous Bronchitis.

Calves have a choking cough. I have lost two, and more are bad. The calves seem to cough and choke and stager and sometimes fall flat.
Also a remedy to kill lice on calves.
Arago, Oregon, J. B. M.

ANSWER.

Your calves have verminous bronchitis; the worms are known as strongylus micrus, which, when in a sexual condition, are located in the trachea and bronchial tubes. The eggs and embryo are developed in the ducts, some of which are expelled by coughing, and continue to grow in pools and swamps. The larvæ are ordinarily taken up with the water and food. Infection of the animals usually occurs in spring, and is very common during rainy years, but may disappear altogether during dry years. It has never been recognized in animals kept permanently stabled. The prophylaxis of verminous bronchitis consists in avoiding wet pastures, and access to pools where infected animals have been allowed to drink. The disease is combatted by medical fumigations, but the most effective treatment is as follows: olive oil, 3 oz.; essence of turpentine, 3 oz.; carbolic acid ½ dram; fetid animal oil ⅓ dram; mix and inject into the trachae 5 drams per day, for three consecutive days.

No. 2. Lice on calves can be destroyed by soaking the calves with a solution of Zenoleum, or any of the coal tar preparations.

Gravel In Hoof.

I have a horse that was graveled about one year ago. It broke at top of hoof and has healed over, but left scar and she is still lame. It is not tender to the touch; foot is not out of shape, but it is hard where it broke and a little larger there just above the hoof.
How much cream, 22% butter fat, from a cow that will make 10 lbs. butter per week?
Pueblo, Colo. H. D. P. R.

ANSWER.

If a graveled hoof has been neglected, it usually leaves the wall of the hoof in

Hog health can be established and maintained at the highest standard by a moderate use of Dr. Hess Stock Food. The hog like all other animals requires a certain amount of food to keep it in normal condition, called the food of support, and it is the food eaten and assimilated beyond the food of support that yields the increase—the food of production. This is why Dr. Hess Stock Food pays. It improves the digestion and assimilation so that it requires less food of support and a greater quantity goes to produce profit. It conditions a hog as nothing else can; gives a sharp appetite, expels worms and affords the means of rapid and perfect digestion of all food eaten. This result is due to the action of scientific tonics and reconstructives selected by Dr. Hess (M. D., D.V.S.). Feed Dr. Hess Stock Food regularly as directed, disinfect the pens and feeding places with Instant Louse Killer, and we guarantee that your hogs will be free from disease.

Dr. Hess Stock Food

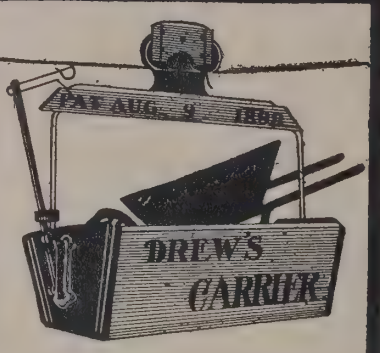
the great hog tonic, is formulated by Dr. Hess (M.D., D.V.S.). If the medical and veterinary schools know of nothing better, it must be good. No unprofessional manufacturer can equal it. A penny's worth feeds eight hogs. It is the only scientific compound for hogs, cattle, horses and sheep sold on a positive written guarantee.

Dr. Hess Stock Food is sold on a written guarantee, 100 lbs. for $5.00 (except in Canada and Pacific Slope); **smaller quantities at slight advance. Fed in small dose.**

Dr. Hess Stock Book Free

This work was written by Dr. Hess (M.D., D.V.S.) and contains the latest treatment of diseases of stock and poultry known to the veterinary profession. It will be sent postage paid to any address if you write what stock you have (number of head of each kind); state what stock food you have fed, and mention this paper.

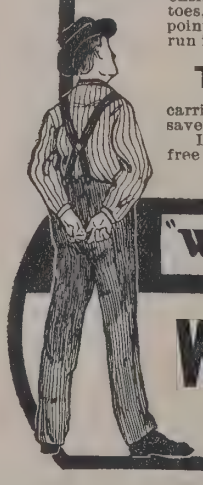
Prof. W. S. Goss, Dean of Talladega, Ala., College, says of it: "I think Dr. Hess' book a little gem. I shall keep it near for reference."



Our Information Bureau.—For any disease or condition for which Dr. Hess Stock Food is not recommended, a little yellow card enclosed in every package entitles you to a letter of advice and a special prescription from Dr. Hess (M.D., D.V.S.). In this manner you are provided with a universal treatment for all stock diseases, either in the stock food itself or in the special prescription to which the little card entitles you.

DR. HESS & CLARK, Ashland, Ohio.

Also Manfs. of Dr. Hess Poultry Pan-a-ce-a and Dr. Hess Healing Powder.



Instant Louse Killer Kills Lice

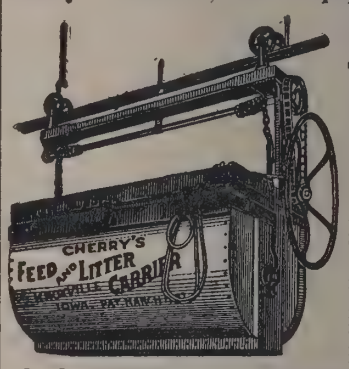
GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The **DREW ELEVATED CARRIER** will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating—it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.



It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

Detroit, Mich., Oct. 16th to 22nd, Christian Church National Conventions.

San Francisco and Los Angeles, Cal. Oct. 20th to 23rd, American Bankers' Convention.

bad shape, which may be the cause of lameness. The hoof is usually hard and brittle. Poultice the hoof with a warm linseed poultice twice daily for three or four days. After this apply axle grease or tallow to prevent the hoof from drying out. Then the enlargement may be blistered with a fly blister of 1 to 4 strength.

Ten pounds of butter should contain 8.25 lbs. of fat, and this will make 37.5 lbs. of 22% cream.

Holding Up Milk.

What is the best way to keep a cow from "holding up" milk, and inflamed udder? I have a cow with calf four months old and I have taken calf away, and have had lots of trouble with her bag and teats. I used camphor, mutton suet and bathed it three times a day with hot water and alt, and she is getting better, but one teat has no milk hardly.

I see where some writer from Vermont says $72 was a good average for a cow in twelve montss, will he tell me how much it costs to feed one for that time, as we sell 900 gallons of milk from a cow at 30 cents, and it costs $7 per month to feed her. This is our average. F. G. M.

Newberne, N. C.

ANSWER.

It is quite likely that your heifer was holding the milk for her calf and after forgetting the calf she will cease doing so. You should not apply camphor to a cow's udder unless you wish to dry her up, as this agent tends to retard the milk flow. Using salt in your fomentations is also a mistake, as it tends to make the udder sore. Hot water alone is sufficient for the fomentation, after which the parts should be rubbed dry and warm. Unsalted lard applied with plenty of hand rubbing. The quarter from which she gives but little milk should be milked as often as possible in order to keep it alive and active.

[See also answer to J. McG.]

Disease Among Cows.

I have been buying some cows from Mississippi and Alabama, and in some instances they take sick in a few days after arrival with a disease similar to bloody murrian and die in a short time. Gretna, La. J. S.

ANSWER.

Please describe disease and we will attempt to diagnose your case and suggest a remedy.

Impotency.

Please give me a remedy for impotency in a bull, caused I think by being poorly wintered and over worked. C. K. R.

Angola, Kan.

ANSWER.

Increase the feed rations and keep him away from cows for a month or two. Give the following tonic: Dried sulphate of iron, 2 oz.; powdered gentain root, 2 oz.; powdered nux vomica, 1½ oz.; nitrate of potash, 1½oz. Mix and give a large teaspoonful three times daily in food.

After Abortion Cows should be injected with Hood Farm Breeding Powder. Used in connection with Hood Farm Abortion Cure it is the best means of preventing abortion.

"Just as good?" "Just as good!" Did you say? "Just as good as Veterinary Pixine!!" The dealer who tells you that is mistaken. He does not know

FACTS AND TESTS PROVE IT!

Emery, Ky., April 9, 1903.

I feel it my duty to tell what Veterinary Pixine did for a horse of mine. He was cut with a knife between the fore legs three inches deep and two inches long, which every minute would gap open. I used several different kinds of remedy without success, even to having some stitches taken. Nothing did any good and it kept swelling and became feverish I almost gave up hopes of getting him well. In the columns of the Ohio Farmer I observed your advertisement and, as it was the last chance, I purchased a box at the druggists and used it as directed and before the box was used up the cut was entirely well. I intend to keep a supply on hand for emergency cases if I have to pay a dollar a box for it. Please accept my thanks for the good I have received from its use, and if you choose you can use my name and testimony.

W. S. CAMPBELL.

This penetrating, stimulating, soothing, absorbing, antiseptic, healing ointment heals from beneath the surface by disinfecting the parts, subduing inflammation and stimulating healthy granulations, not by drying and scabbing, and stimulates growth of hair, natural color. Makes quick, clean and healthy cure; heals stinging, burning, chronic saddle and collar galls, hopple chafes, abscesses, caked bag, cow pox, and hoof rot. It penetrates, stimulates, soothes and heals while horse works. Money refunded if it fails.

21 STRONG REASONS

WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to **own** a low-priced farm than to **owe** for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agriculturial districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.

WISCONSIN BLUE GRASS LAND CO., Baldwin, Wis.

DAIRY FARM FOR SALE

At **ANN ARBOR** near **DETROIT, MICH.** A thorough dairy farmer with capital can learn of a handsome investment by addressing subscriber.

A 575 Acre Dairy Farm near Ann Arbor, Mich., university town, can be had at a reasonable figure. This is the only Cow Stall with a centering hinge. Stalls all fold back to manger as the cows go out the barn. When ready for use, by starting one stall all come into position. No post at the gutter. Send for circulars.
R. A. McLERY & CO., Palmyra, Wis.

Improved and Unimproved Farms for Sale

Farm No. 1 consists of 90 acres with frontage on a fine lake where there is excellent fishing and game. This lake is one of a chain of lakes on which you can travel for twenty-three miles. Has two-story house with eight rooms. Two-story log barn. Ice house and ten acres cleared. For sale at a bargain. One mile and a half from the railroad.

Farm No. 2. One-half mile from the railroad. 100 acres or more if desired, five acres cleared. Two-story, eight room house. Glass chicken house. First-class hog pen. Plenty of timber on land for own use, and quite a quantity of saw timber. We have besides this 16000 acres of unimproved land. Heavy black soil. All lies in Central Wisconsin. Low priced Excellent markets. Will grow any kind of crop and produce immense results. Excellent water supply. Splendid markets and a local demand for everything that is raised. None of the land lies more than three miles and a half from the railroad.

WISCONSIN FARMS

Will furnish names of people who have bought from us who have made big success. Can furnish lands in either small or large quantities. Can furnish reduced rates to see the lands. Easy terms to suit the convenience of the purchaser. As safe and desirable an investment as government bonds. Write in for maps and any information you may desire.
INTERIOR LAND CO., Janesville, Wis.

I Can Sell Your Farm

or other real estate, **no matter where it is or what it is worth.** Send description, state price, and learn my wonderfully successful plan. **W. M. OSTRANDER,**
North American Building, Philadelphia

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn, (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

Address BOX G., Morristown, New Jersey.

"ADVERTISEMENT."

THE ROOT OF THE MATTER

He Cured Himself of Serious Stomach Trouble By Getting Down to First Principles

A man of large affairs in one of our prominent eastern cities by too close attention to business, too little exercise and too many club dinners, finally began to pay nature's tax, levied in the form of chronic stomach trouble; the failure of his digestion brought about a nervous irritability making it impossible to apply himself to his daily business and finally deranging the kidneys and heart.

In his own words he says: "I consulted one physician after another and each one seemed to understand my case, but all the same they each failed to bring about the return of my former digestion, appetite and vigor. For two years I went from pillar to post, from one sanitarium to another. I gave up smoking, I quit coffee and even renounced my daily glass or two of beer, but without any marked improvement.

"Friends had often advised me to try a well known proprietary medicine, Stuart's Dyspepsia Tablets and I had often perused the newspaper advertisements of the remedy but never took any stock in advertised medicines nor could believe a fifty-cent patent medicine would touch my case.

"To make a long story short I finally bought a couple of packages at the nearest drug store and took two or three tablets after each meal and occasionally a tablet between meals, when I felt any feeling of nausea or discomfort.

"I was surprised at the end of the first week to note a marked improvement in my appetite and general health and before the two packages were gone I was certain that Stuart's Dyspepsia Tablets were going to cure completely and they did not disappoint me. I can eat and sleep and enjoy my coffee and cigar and no one would suppose I had ever known the horrors of dyspepsia.

"Out of friendly curiosity I wrote to the proprietors of the remedy asking for information as to what the tablets contained and they replied that the principal ingredients were aseptic pepsin (government test), malt diastase and other natural digestives, which digest food regardless of the condition of the stomach."

The root of the matter is this, the digestive elements contained in Stuart's Dyspepsia Tablets will digest the food, give the over-worked stomach a chance to recuperate and the nerves and whole system receive the nourishment which can only come from food; stimulants and nerve tonics never give real strength, they give a fictitious strength, invariably followed by reaction. Every drop of blood, every nerve and tissue is manufactured from our daily food, and if you can insure its prompt action and complete digestion by the regular use of so good and wholesome a remedy as Stuart's Dyspepsia Tablets, you will have no need of nerve tonics and sanitariums.

Although Stuart's Dyspepsia Tablets have been in the market only a few years yet probably every druggist in the United States, Canada, and Great Britain now sells them and considers them the most popular and successful of any preparation for stomach trouble.

French Canadian Cattle.

Will you please write me how the French Canadian cattle compare with the Jersey cattle for milk and butter?

Would you think it advisable to cross a grade Jersey dairy with a thorough-bred French Canadian? G. W. K.

Delaware Co., N. Y.

We cannot answer inquiries of this character by letter, even though stamps may be enclosed for return postage, as was the case in this instance. If we should undertake to answer inquiries by letter, there would be little or no time remaining that we could devote to editorial duties proper. Hence, in undertaking to answer inquiries at all, we are governed by the presumption that the answers may be of more or less general interest to a large number of our readers. The present inquiry is a good illustration of this fact. It is fair to assume that there may be a great many readers who want to know something about the French-Canadian cattle.

The only time that these cattle have been brought into prominent public notice was at the Pan-American Exposition in 1901. It was there demonstrated that they were very economical producers of butter fat. The probabilities are that this breed originated from very early importations of Jersey cattle by the French settlers in what is now the Province of Quebec. They are of small size, and have for many generations been subjected to the somewhat scanty fare and rigorous climate of that province, and have thus acquired their distinctive breed characteristics. They are not large producers and cannot be made large producers, but they have the ability to use feed very economically indeed.

One serious popular objection to Jerseys is their medium or small size. The use of French-Canadian sires on grade Jerseys would be apt to intensify this objection. Otherwise, we see no objection to such a cross on grade cows.

Sorghum for Silage.

Have not enough ensilage corn to fill silo but have about 4 acres of cane. How would it do for ensilage? H. R.

Postville, Iowa.

We have never used sorghum (cane) for ensilage, but a goodly number of our readers have reported its use and great satisfaction therewith. Whenever it is practicable, it is better to mix the sorghum with corn as it goes into the silo, rather than have to feed at one time all corn silage, and at some other time all sorghum silage.

ILLUSTRATION

THE LIFE OF THE METAL WHEEL.

The progressive farmer values the "Low-Down" and Metal Wheels. It is only necessary to know the constantly growing demand for these wagons entire, and especially wheels made to fit the ordinary farm wagon, to judge of their value in the harvest field (when wooden wheels are going to pieces just at the busiest season); to recognize their worth in the hay field or the barn-yard, where one must "pitch up" unnecessarily high on account of high wooden wheels; or understand the value both to land and team, of a wide tire that will stay "on top", as the farmer is compelled to travel over his fields when the ground is soft. The question of price and durability is important in determining what kind of metal wheels one would purchase. The life of a metal wheel depends almost entirely on the method of fastening the spoke into the tire. Experience and practical tests have demonstrated that where they come loose is in the tire; hence the problem has been a substantial fastening of the spoke to the tire. With the plain tire the weight of the load must all fall upon the head of each spoke, tending to loosen it, and to lend a jolting motion to the vehicle. With the plain tire too, it is next to impossible to use a "rub-lock", as is often necessary in a hilly country; so working to overcome these objections, 'necessity became the mother of invention", again, and the grooved tire here illustrated, has come into the manufacture of metal wheels, making the wheel more durable, protecting the heads of the spokes, permitting the use of the rub-lock on a smooth surface and removing the jolting motion, making the most durable common-sense metal wheel that has ever yet been put on the market. The Havana Metal Wheel Co., Havana, Ill., are the exclusive manufacturers of the grooved tire wheels, and will gladly send catalogue and particulars of same, on postal card application.

Watering the Herds

WITH the fencing of the ranges has come the need for an artificial water supply upon the great stock farms of the West. That cattle may thrive and fatten for the market, it is absolutely essential that this supply be both *constant* and *abundant*. The picture shows a typical scene upon many of the largest ranches, where the **HOT AIR PUMP** is delivering its supply into the storage tank, whence it is drawn off daily as required, in any volume up to 100,000 gallons. No driving of the herds to some distant river is required, thus much expense is saved and the cattle drink quietly, as nature dictates, at an *ever ready* and *abundant* supply. Descriptive Catalogue B3 sent free on application.

Rider-Ericsson Engine Co.

35 Warren St., New York.
40 Dearborn St., Chicago.
40 N. 7th St., Philadelphia.
239 Franklin St., Boston.
692 Craig St., Montreal, P. Q.

Teniente-Rey 71, Havana, Cuba.

Remember, the Hot Air Pump is Automatic, requires no skilled attention, and is the cheapest form of constant water supply now known.

Made for the Man Who Wants the Best.

The Great Western Endless Apron Manure Spreader.

This Machine will be Exhibited in Operation on the Fair Grounds at the Wisconsin State Fair

at Milwaukee, Sept. 7 to Sept. 11, inclusive. It will be shown spreading the manure just as it does in the field. The exhibit will be in charge of experienced manure spreader men who will be thoroughly competent to explain all details and answer all questions, and will take pleasure in doing so. The president of the company, Mr. F. S. Smith, will be present all of the time and will take great pleasure in meeting and talking with the prosperous Wisconsin farmers. Don't fail to see this exhibit. It will be of more real value to you than anything you will see during the fair.

REMEMBER The Great Western is the only Endless Apron Manure Spreader. You will realize how much this means when you see it in operation. Should you be unable to attend the fair, write for large illustrated catalogue. It fully illustrates and describes the machine. Mailed free.

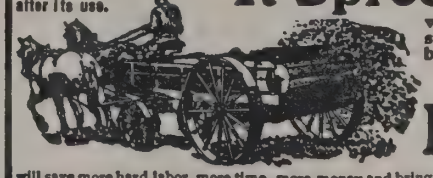
SMITH MANURE SPREADER CO., 59 N. JEFFERSON ST., CHICAGO, ILL.

WIND MILL

$1000 Reward

REVOLUTIONIZES WIND POWER.

2-14ft. Wheels.
10 horse power



All the power you need for $1.00 per MONTH.

Address
Double Power Mill Co.,
Appleton, Wisconsin

It pays for itself on the first crop grown after its use.

It Spreads Manure,

wet, dry, lumpy, caked, strawy, full of corn stalks, etc., better than it can possibly be done by hand. Spreads lime, ashes, salt, compost, etc.

THE IMPROVED

Kemp Manure Spreader

will save more hard labor, more time, more money and bring about better results than any other machine that can be employed on the farm. It trebles the value of even a small amount of manure. It is the only thing that can successfully top dress wheat in the spring, meadow lands, pastures, etc. Can be hauled onto any land easily and without injury to land, as wheels have broad tires. Can be turned on the ground it stands on, as front wheels turn entirely under. It is strong and durably made of good material and with ordinary care will last indefinitely. Greatly improved for 1903. Send for new illustrated catalogue and "How to Grow Big Crops"—Free. Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.

5 LBS. PER DAY IS AN EXTRAORDINARY GAIN

ROCKPORT, KANSAS, Nov. 21, 1902.

International Stock Food Co., Minneapolis, Minn.

DEAR SIRS:—Your **"International Stock Food"** is all you claim for it. We have the nicest pigs and hogs that we ever had. Tested it on one old sow that was very poor from suckling pigs. She could hardly make a shadow. We took the pigs away and fed her **"International Stock Food"** in her feed and I do really believe that she put on 5 pounds of flesh per day. Yours truly, M. C. JERBY.

☞We Have Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine and Unsolicited.☜

We own "International Stock Food Farm," which is located 12 miles from Minneapolis and contains 650 acres. We feed "International Stock Food" every day to all of our WORLD CHAMPION STALLIONS, DAN PATCH 1:59 1/4 and DIRECTUM 2:05 1/4; to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. "INTERNATIONAL STOCK FOOD" ☞ 3 FEEDS FOR ONE CENT ☜ is Prepared from Roots, Herbs, Seeds, and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human System. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these medicines promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High-Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Fifty Thousand Dealers throughout the World. ☞Your Money will be Promptly Refunded in Any case of failure. It will make your Calves or Pigs grow Amazingly and has the largest sale in the World for keeping them healthy. ☞Beware of the many Cheap and Inferior Imitations! No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or a Falsifier.

WHAT PEOPLE SAY ABOUT THIS BOOK.

INTERNATIONAL STOCK FOOD CO., EAU CLAIRE, WIS.

Dear Sirs:—I received your "International Stock Book" and was more than pleased with it. It is worth more than $10.00 to me. Very truly yours, RICHARD J. MORRISSEY.

INTERNATIONAL STOCK FOOD CO., ODESSA, MO.

Dear Sirs:—Your "International Stock Book" duly received, and it is the best thing of its class that I have ever seen. There is a volume of useful articles in it from start to finish. Respectfully, GEO. W. NULL.

A $3000.00 STOCK BOOK FREE

IT CONTAINS 183 LARGE ENGRAVINGS OF HORSES, CATTLE, SHEEP, POULTRY, ETC.

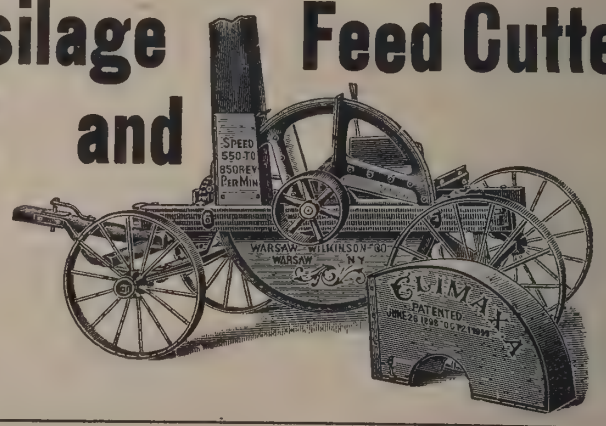
SAVE THE WHOLE CORN CROP

A corn crop may be profitable without saving the fodder, but it will be twice as profitable if it is saved. The new method of handling corn saves the entire crop. The new way is to run all the corn through

JANNEY COMMON SENSE CORN HUSKER and FODDER SHREDDER



If you feed corn hay you can sell all your meadow hay. You can also bale and sell your surplus corn hay; big demand. You may add further to your profits by husking and shredding for your neighbors. Pays better than a threshing machine and costs less. Eight years in the field; more in operation than any other.

Best made. It husks all the corn and shreds the fodder into "corn hay." Corn hay is the equal in feeding value of best timothy hay. Ask your dealer or write us for Husker Catalog.

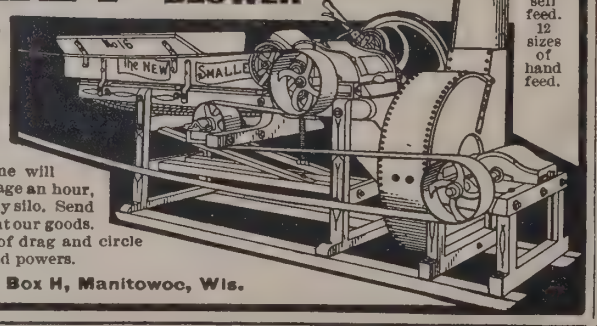
CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.



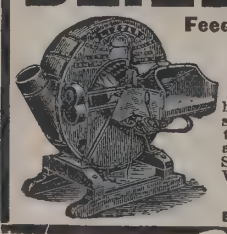
The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

SMALLEY SAFETY BLOWER

Only One Belt Required.

No lost power. No danger in operation. Belt cannot slip. Every part strong and of best material. No more strain on the *Smalley* machine when Blower is attached than with the ordinary carrier. Largest size machine will easily handle ten tons of ensilage an hour, cut 1/2 inch and elevate into any silo. Send for 1903 catalogue, tells all about our goods. We also make complete line of drag and circle saw machines, sweep and tread powers.



6 sizes self feed. 12 sizes of hand feed.

SMALLEY MFG. CO., Box H, Manitowoc, Wis.

BLIZZARD

Feed and Ensilage **Cutter**

Does everything, cuts hay, straw, ensilage, shreds fodder and fills the silo to any height; all done by one machine. Sold on full guarantee. Write for catalogue.

Convenient Separators

No dairyman or farmer wants a complicated—hard to use—hard to care for machine about the farm. Such machines are not convenient—not sufficiently simple and easy to operate.

NO dairyman or farmer who intends to buy a separator wants one hard to feed—hard to turn—hard to clean—hard to keep in repair. He'll make up his mind to get the one that does the most work, with the least trouble—one that any man or woman, boy or girl can run easily and safely. Simplicity places the

Dairy Tubular Separator

FAR ahead of the antiquated bucket bowls all other separator manufacturers are making. It is the only separator with a Tubular Bowl—all others have top heavy bowls set on slender spindles that vibrate and bind. It is the only separator without complicated, troublesome, hard-to-wash parts in the bowl—all others are full of antiquated nuisances such as discs, cones, vanes, etc. It is the only separator having perfectly en closed, self-oiling, easy-to-reach gears—all others have gears that need watching, oil cups that need filling. It is the only separator with a supply can waist high—all others have cans head high. It is the only separator that can be washed clean in five minutes—all others take much longer.

To learn all about Tubular Separators write for free Catalogue No. 144.

Blood Meal for Calves.

ED.—HOARD'S DAIRYMAN:—On page 549, you speak of feeding "blood meal" to young calves and pigs. How much do you give at a feed, and how old are they when you begin? Do you cook or steam it?

Is this blood meal the same as the fine black meal sold by grain dealers, for feeding poultry, called animal meal, a product of the slaughter houses?

Derby, Conn. D.

The above inquiry has been made by several parties and the following answer will do for all:

We commence the use of blood meal with the calf a week or ten days of age, feeding a full teaspoonful at that age, in the milk. As the calf progresses in age and weight, we increase to a table spoonful, heaping full, twice a day, at five and six months of age. It is an excellent preventive of scours and one of the best forms in which to feed animal protein. We have used it with much satisfaction, for several years. With pigs, about half the amount per animal that is used with calves is a safe ration.

To all practical purposes, blood meal and dried blood are the same compound.

Note and Comment.

Putting Doors in a Wooden Hooped Silo—Preserving Milk in Ohio-Cheese Troubles in Canada—The Producer and the City Milk Dealer.

ED. HOARD'S DAIRYMAN: — "Yours Very truly" seems to be fated to be misunderstood, and the wooden hoop business is apparently a case of his undoing. H. E. T., of Mich, askes me to tell him just how he can put doors in a wooden hooped silo, when it has double boarding. Well, never mind the out siding. Make the outside man-hole 8 inches wider than the inside one. Have the inside man-hole 20 inches wide, and reach from hoop to hoop. In other words when you ceil up, stop when you get within 20 inches from where you started. That will make a continuous barred door with the hoops. Take some 2x4 inch stuff, and cut them just long enough to go in flatwise between two hoops, one on each side of the man-hole, push them in so that the man-hole will be only 18 inches wide. Toe-nail them at top, and bottom to the hoops, and nail the edges of the lining of the silo to these perpendicular 2x4's and you have a door-way with side jambs.

Make a door to fit this hole, long enough to reach from the center of one hoop, to the center of the one above; the hoops making the cross jambs of the door. When you fill the silo, hang a strip of tarred paper over the door-way on the inside, covering the doors, and out onto the sides a few inches, and you have a man-hole door in place and air tight. For the outside, make, or not as you wish, a door without turn hinges. Do not close up the space between the 2x4's and the out siding leaving this space 1x16 inches for a ventilator. Is this clear neighbor?

Since my last, two things have broken loose in dairy circles. The state commissioner has picked up a whole lot of milk venders who have been aiding their milk to keep sweet longer than Prof. Babcock's enzymes dictate, and they have found that Horace Ankeney "do live;" and have been paying into the public treasury, each, $100 and costs; and along with them not a few hotel and restaurant keepers who have forgotten to place conspicuously the 18-inch square sign, "oleo used here," pink, straw or natural color, a thing the most of them have forgotten to do. In fact, there has never before been any necessity for the bogus fellows to observe anything but paying the express charges on their Chicago butter (?) and claiming that it was made on order by Deacon Silas Cummin' up t' Bass Lake. It is now announced that order is to come out of our long night of official darkness, and we are to find out if we can how it is that we have lost $5 a head on all of our cattle, when increasing sales (?) prove that the people are preferring white oleo to the best butter. That beats the separator advertisements.

Reference to Bro. Wheaton's letter in the DAIRYMAN breaks me all up, and I fear that the bad flavors that are so troubling the Government over there, will lead to a state of affairs that exists in the States, being compelled to eat one's own cheese, and have it come to more than if exported. We had supposed that carrying whey home in the milk cans was an obsolete practice in the province, but that 81 out of 82 still cling to this practice, explains why the Dominion Government has to build cheese refrigerators, and freeze cheese solid before they can be exported. Possibly, if the patrons were to deliver frozen milk, the makers would find as Mr. Wheaton says, "that milk at this low temperature will withstand the growth of many of these lower forms of life which cause bad flavors in milk." Over here, all these troubles are easy to locate, as they are directly charged to Mark Hanna, the Tariff, or Imperialism. It would seem with four syndicates, besides Dan Derbyshire and A. McLaren, that bad flavors might be kept out of Ontario, and the old time prestige of the cheese industry regained. Better annex the American idea of making cheese so good that it will be eaten at home, and Wheaton's next letter will be as bright as as an X-ray.

A big effort is to be made early in September by the milk farmers about Cleveland to co-operate for once, and see if something like a fair price cannot be had for milk the coming winter,—18 cents for an 8½ lb. gallon. It is said that the dealers concede 17, but some one has figured out that it costs 13½ cents to produce a gallon of milk, and that the farmer ought to have as much profit on his gallon sold, as the peddler on his quart. Feeds are up, and wages too, and the only way that the farmer sees to get his share of the 8-cents-a-quart milk, is for once to "hang together" and demand fair prices, for it seems none of the city dealers are afraid of a plethora of riches, or a disposition to bestow any great amount of their goods upon the poor.

Most of the city dealers have not returned yet from their summer outing in Europe, so the day of the meeting to settle prices will be held Sept. 4th. One thing the farmers should insist upon, and that is, that the city dealer should be licensed, and his rig tagged; dirty, impure, doctored and low grade milk should be made a matter of instant confiscation, and throwing into the sewer; and milk depot venders, hotel and eating house keepers should come under the inspector's law, and stop this skim-milk-for-coffee side play; and the milk sold shall be pure, clean, up to standard, from cow to final consumer. There is a lot of horse play going on, which the "old hayseed' gets the blame for, and if there is no remedy, stop the shipments. "Oh," says one, "what shall we do with our milk?"

Yesterday, I attended a farmers' meeting, and the milk situation came up as a side, behind-your-hand conversation, and this is the sum of it: "If we can't get fair prices, let us build a creamery near the shipping station, run it ourselves, as a body. If they buy our milk, buy it of the farmers' company, and deal with it, and not as single patrons. If they won't pay good prices make it into butter and cheese, and still deal company as against company."

What is the matter with that proposition? Up in Lewis Co., New York, I found some of these co-operative concerns, with nice little creameries built at a railroad station, and yet not one of them had ever been run, but they were kept ready to run, at an hour's notice, whenever the great New York syndicate attempted to put milk down below a living rate. Of course the interest on such a plant is $150 per year, but a cent on a gallon for 15,000 lbs. of milk means $1.50 a day, and that alone soon returns the interest lost.

It is somewhat natural for the dairyman to count his business connections as an abounding source of woes, and may be he does have low prices, and some poor cows, and is not allowed to skim, water, or doctor his milk, before *he* sells it; but his only way out, is to co-operate in a way that he can make himself felt, and have two strings to his bow; then he can catch the city dealer either going or coming, and if he is honest himself and does not demand the earth, it looks as if he could hold his own, and live uprightly.

The Season and the Schools.

ED. HOARD'S DAIRYMAN: — It is sometime since I sharpened my pencil to write for your valuable pages, although I have read them weekly. We have experienced a very peculiar season in this section, but it has worked out well in the end. Last April when the snow left us, we found grass and pasture had wintered well, and every indication was favorable for a large hay crop. The ground pulverized up well, and oats were gotten in in good shape early in April, and farmers were hopeful.

We had all read of a rain that lasted 40 days and 40 nights, but 40 days and 40 nights without rain enough to spoil a new spring bonnet in May and June, was something entirely new to us. Pastures and meadows lost their verdure and turned gray. Oats and corn failed to germinate and conditions did indeed look serious, and the nervous, pessimistic farmer was ready to throw up the job. The first sprinkle of rain came the 8th of June and from that on we had no lack of moisture, and the complexion of all nature changed, with the result that we have harvested the largest hay crop and of the best quality we have had in years. We are harvesting more than an average crop of oats, and potatoes are immense although not a very large acreage as cut seed failed to come up well, and some soils dried so hard it was impossible to plow and cultivate.

All crops have been about three weeks late, and corn, where it has a good stand, is looking fine and gives promise of an immense crop, but we must have a favorable September and we hope for it, and we sometimes get it. We have corn that was planted the 14th of June that will harvest a mature crop with fair weather, without frost by September 20. The insect pest, potato bugs, grasshoppers and also cattle flies have been a very light crop. The foliage on trees never looked richer than it has this season, with no visible worm or insect enemy. Dairies have produced large quantities of milk.

Our dairy, with ample pasture of a variety of grasses—mostly blue grass and white clover—gave us the lowest test for the month of July, at the creamery, we have ever had. They tested one per cent lower than last November. We don't know whether it is the dairy, or the Babcock tester, or the man behind the bottles. We can see no reason for it. No change in the dairy except the addition of six heifers that freshened in February and May. I don't like to be hasty in judgment, but it looked as though some one had blundered.

I notice in your issue of Aug. 21, our friend, John Gould, of Ohio, speaks of the great advantages of the centralized schools. They may be all right in Ohio, but in this locality they have their disadvantages, especially for the primary classes. We have here in Sandy Hill a high school that is rated second to none in the state, with an attendance of nearly 800 scholars. There are usually about 75 that drive in from the country. Every June time when the graduating class lines up, more than one-half of the graduates are from those few that come in from the country, which fact leads me to believe that the little red school house on the cross roads is a pretty good place for a primary commencement. In some localities here they are discontinuing their district schools and in many cases to the detriment of the community.

In some instances they leave large families of children three or four miles from school with no way of getting there except to walk. Sometimes a conveyance is furnished, commonly called the "kid wagon." I followed one of those conveyances a couple of miles last fall, which perhaps was as good as the driver could afford to furnish for the pay he was getting. He was driving an old skate of a hungry looking team hooked to an old canvass covered wagon nearly destitute of robes or blankets, crowded in with a lot of big, rough boys. The moral atmosphere of that wagon for a little girl 8 to 12 years old, was just about equal to that of a concert hall on the Bowery, beside being cold and uncomfortable.

We see boys starting in here from the country, their pants reaching near their ankles and their neckties climbing over their collars, and called buckwheats by the village boys. They enter a class outnumbering them nearly 10 to 1, and are quite apt to come in at the finish the valedictorian of the class. We don't claim lack of ability in the village boys, but the fact goes to show that the little red school house is a good primary.

Sandy Hill, N. Y. FRANK SHELDON.

Purifying the Cream.

During the last three years, considerable effort has been made to find a means by which the odor and taste of wild onion and bitter weed may be removed from milk and cream. In the spring of 1901, the writer was requested to try a patent compound claimed to remove all kinds of weedy taste from milk, but it proved to be an absolute failure. Cooking soda (saleratus) was also given a like trial, but failed of the purpose claimed for it by some people. Having failed so far to find anything that when fed to the cows would remove weedy taste in the milk, the next step was treating the milk and cream. Bitter weed taste was removed entirely from cream by thoroughly mixing it with two or more parts of water at any temperature above 70 degrees Fahrenheit, and then running the whole through the separator. Saltpetre dissolved in water was tried as an aid in removing the bitterness, but as good results were secured without it as with it. Rapidly and slowly heating milk and cream to various high temperatures did not remove bitterness, but often imparted a cooked taste. Butter made from washed cream (as above) was pronounced free of all bitterness by the station customers. Butter made from unwashed cream was decidedly bad and was often rejected by the customers. No means were found to remove the bitter weed taste from whole milk. In the spring of 1902 milk and cream were treated for the wild onion flavor the same as in the previons year for the bitter weed taste.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons or the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

THE *Grass Lake* (Mich.) *News* made mention last year of one of its subscribers, Mr. Dudley Vosburg, who had been a patron of the local creamery as well as of the condensed milk factory. Being of a figuring turn of mind, and withal a reading man, he kept track of all the values involved in both ways of disposing of his milk. Rightly enough Mr. Vosburg figured that he could not part with the skim milk without serious loss to the growth of young animals on his farm, and that would bring a loss of fertility. His idea of farming is that he must pursue that method that will bring him the largest amount of manure. For that reason he keeps a large amount of young stock constantly growing. Mr. Vosburg's conclusions are that he cannot afford, either in point of direct cash revenue or for the benefit of his farm, to forego the use of his skim milk.

A JUST DISTINCTION.

All sorts of men keep ,cows the same as all sorts of men practice law or medicine, or edit newspapers. In every business there is a thinking, reading, studying class, who really set the pace for the rest to trot by. These thoughts are evoked by the following observation, made by a friend in Pennsylvania who sends us a list of names of dairy farmers in his vicinity. He says:

"I have given the names of those most interested in papers that aid in educating them in the work in which they are engaged."

Some men are interested in anything which will aid them in obtaining a better understanding of their work.

Others care nothing for such an understanding. They look on their work from the lowest level, and consequently what they get out of their work, whether it be money, or the respect of men, is of the least possible account. Every man's estimate of his work depends on the width of his horizon. A man at the bottom of a cellar cannot see half as far or half as much, as if he stood on the house top. Some men want every aid to their vision and standpoint they can get; others, and by far the largest number, don't see much, nor do they want to. Every man should ask himself the question: To which class do I belong?

THE RELATION OF SCIENTIFIC INVESTIGATION TO FARM PRACTICE.

The reading of the interesting article written by Mr. C. L. Gates, on page 674, in last week's issue of the DAIRYMAN, brings up a train of thought. The farmer who has never given his mind any exercise in the direction of accurate scientific investigation, will ask the question: What is the good of all such work? As a rule, farmers are not disposed to take very kindly to fine spun, scientific theories. But this view is erroneous. The object of the scientific student is not to make money; it is to find accurately just what are the laws that govern any of the processes of nature.

Before men can take full advantage of any of those processes they must be exhaustively studied, every ray of light followed out and a complete understanding had of all the laws and principles that govern their action.

This has been the case with the steam engine and all other mechanical devices; with electricity, with hydraulics, with the study of the laws of light, heat and all forms of potential energy. So it is with the laws that govern the action of health and disease. The first step to be taken is to thoroughly understand the governing principles; next by invention to make use of these forces for the benefit of man. The effort of Prof. Armsby to exhaustively study from the scientific standpoint, what is the total fuel value of the food which is to drive the machinery of the body of the steer, is not mere theory as some men call it. Indeed, there is no theory about it. It is an exhaustive study of the facts of digestion, and just what is the waste through the bowels, the urine, the skin and the breath.

When once those facts are clearly established, the practical man who is intelligent can take advantage of the road which has thus been surveyed out, and make it conducive to his profit. Prof. Armsby is studying out the *why* so the practical feeder can more perfectly know *how* to proceed. It would be greatly to our advantage as farmers if we were better educated so we could have more and larger intellectual understanding of the meaning of science and its application to the uses of agriculture.

THE VALUE OF A RIGHT IDEA OF THINGS.

A quaint old Yankee in New York, when we were boys, used to have the habit of saying: "It is mighty important to have the right idea of things to start with." One day a young bull tackled the old man in his barnyard. Uncle Sam grabbed the bull by the tail and gave him a severe lashing with a black-snake whip, which he happened to have in his hand. His bullship soon gave up the fight and was glad enough to get away. Uncle Sam said very quitely: "He's sort 'o young and foolish: you see he didn't have the right idea of me an' other things to start wirh."

The corn crop is three weeks late in the west, and there are hosts of dairy farmers who wish now they had a silo to put a good portion of their crop in, for in that way they could secure the full value of both ear and stalk, as feed for their cows next winter. They have not had the right idea of this matter to start with.

Three patrons of the Hoard Creameries were talking on the street corner, in Fort Atkinson the other day. They all agreed that they made a big mistake a few years ago when they quit keeping a good registered dairy bull at the head of their herds. Said one: "My heifers are not worth half as much for milk as those I used to raise ten years ago from a Jersey bull. I paid $80 for him, and I wish I had him back again." Said another: 'This idea of trying to put both beef and milk into the same animal is a humbug. I thought my Guernsey grade cows were not quite large enongh, and so I bought a Short-horn bull and the cows he brought me, don't begin to bring as much money as their mothers did."

You see he bred downwards, and not upwards; away from the pail and churn and not towards them; wrong ideas of dairy breeding to start with.

Said the third: "If I had known as much then as I do now, I would have built a good barn and a silo ten years ago when lumber was cheap. I had the money, but I hated to call it in from where it was loaned at six per cent, and now I dread to start building because everything is so high."

This man has lost the use of a good barn and silo for ten years, which would have paid three times six per cent. And he did not have the right idea of things to start with.

These three men are typical of a great host of men who are keeping cows. They are constantly at cross-purpose with the right idea of dairy management. The right start in everything is a right idea of what we want to do. A neighbor, who had fought the idea of a silo for fifteen years, sent his boy to the Short Course one winter, at the Wisconsin Agricultural College. The boy came home and stirred the father up to build a silo. Now he says he don't see how he ever got along without one. Lots of men are as afraid as death of a new idea. Some men make progress in ideas and the doing of things backward, the same as does a cat that is is pulled by the tail. It is better, cheaper, and much more profitable to keep our face to the front.

It is the character and quality of our ideas of our work that tells the story for or against us. Bad luck generally comes from adopting a wrong idea, or using a wrong method. But the great point for every man, whatever his occupation may be, is to carry constantly with him the thought that he and he alone is responsible for the ideas he has.

Every man must be his own school master. He must direct his own mind. If he refuses to make provision for himself whereby he can secure a supply of good ideas, then he is to blame.

Too many of us feed our hogs to the verge of cholera, and starve our minds. We must have contact with ideas if we expect to secure them. We must come near to the fire if we expect to be warmed. Again we are reminded of the old proverb: "As a man thinketh (has ideas), so is he."

FLAVOR AND AROMA.

That very excellent little work "Elements of Dairying" by Prof. James Long, England, contains the following interesting chapter on "Flavor and Aroma" in butter:

"According to Storch, whose investigations have been very extensive, the flavor of butter is derived from the serum, not from the fat of milk or cream. Butter produced from first skimmed cream which has been churned while still sweet, is deficient in that fine flavor which is characteristic of butter of the highest type. On the other hand, it retains the mild, delicate flavor of the cream. The wealthier of the French consumers prefer butter of this kind. It is made in comparatively small quantities, but it is imitated to an enormous extent by the aid of almost tasteless fat of another kind, with which butter of fuller flavor is blended.

The flavor of good butter is improved by the addition of a small quantuty of very fine, dry salt. The addition of salt if preferable after the butter has been partially worked. Brining, excellent as the practice is, cannot take the place of dry salting, so far as it contributes to the improvement of flavor.

Flavor is also affected by the food given the cow. Where the milk is *properly managed*, complaints are never made when cows are fed on good grass or hay.

Under stall feeding, excessive quantities of roots, sour grains, rape, or cabbage, deteriorate flavor. Sour ensilage and fermented foods of all kinds are also untrustworthy in a butter dairy. Among the best suitable foods for addition to hay and grass are bran, cotton cake, oats, pea meal and malt culms.

The aroma of butter is no guide to its keeping quality, however agreeable it may be on the palate. It changes rapidly in newly-made butter, which is exposed to light or air. This fact will be observed if a test is made at the end of twenty-four hours.

As with flavor, the aroma of good butter, insipid immediately it has been made, requires time to develop. For this reason among others, the practice of judging butter direct from the churn is incorrect.

Duclaux thinks that aroma may proceed from the products of the ferments in the cream, or "perhaps to some traces of caproic or butyric ether, formed at the expense of small quantities of these acids, which are present in all butters in a free state."

In another place Prof. Long says that butter which is almost white, is inferior in flavor to that which is rich in natural color. In England the owners of Guernsey cattle make the claim that the butter from their milk is of superior flavor, owing to its high color. Here is a field for investigation by some of our experiment stations.

ABORTION.

This is a subject of constant and almost supreme interest to every owner of a dairy herd. HOARD'S DAIRYMAN is always on the lookout for the best and latest information that will instruct its readers on this important question. In the *New York Tribune Farmer* of May 28th a subscriber describes his troubles with this disease and asks Dr. Smead, the veterinary editor, to give him some advice. The Doctor writes so well and intelligently on the subject that we place his answer before our readers.

Answer: The question you ask is of such general importance that, although much has been already written and gone into print in regard to it, I will, at the risk of repeating some things already said, give in a general way some things that cattle owners must take into consideration when the trouble you ask about breaks out in a herd.

First—They must bear in mind that the cows of today, whether they have been bred for beef or milk production—either one, I care not which—have been so treated as to weaken the reproductive organs; and cattle that are highly bred—perhaps inbred to some extent, to establish so-called types—are bred with uterine weakness. As an illustration of this: A cow with an inbred tendency to lay on flesh is quite likely to have from calf-hood a uterus more or less dwarfed by fatty tissue; while one bred with an udder development sufficient to feed two or more calves is usually found with her reproductive organs lacking in nerve tone and vitality; and many of them, in middle life, become sterile or abort from uterine weakness

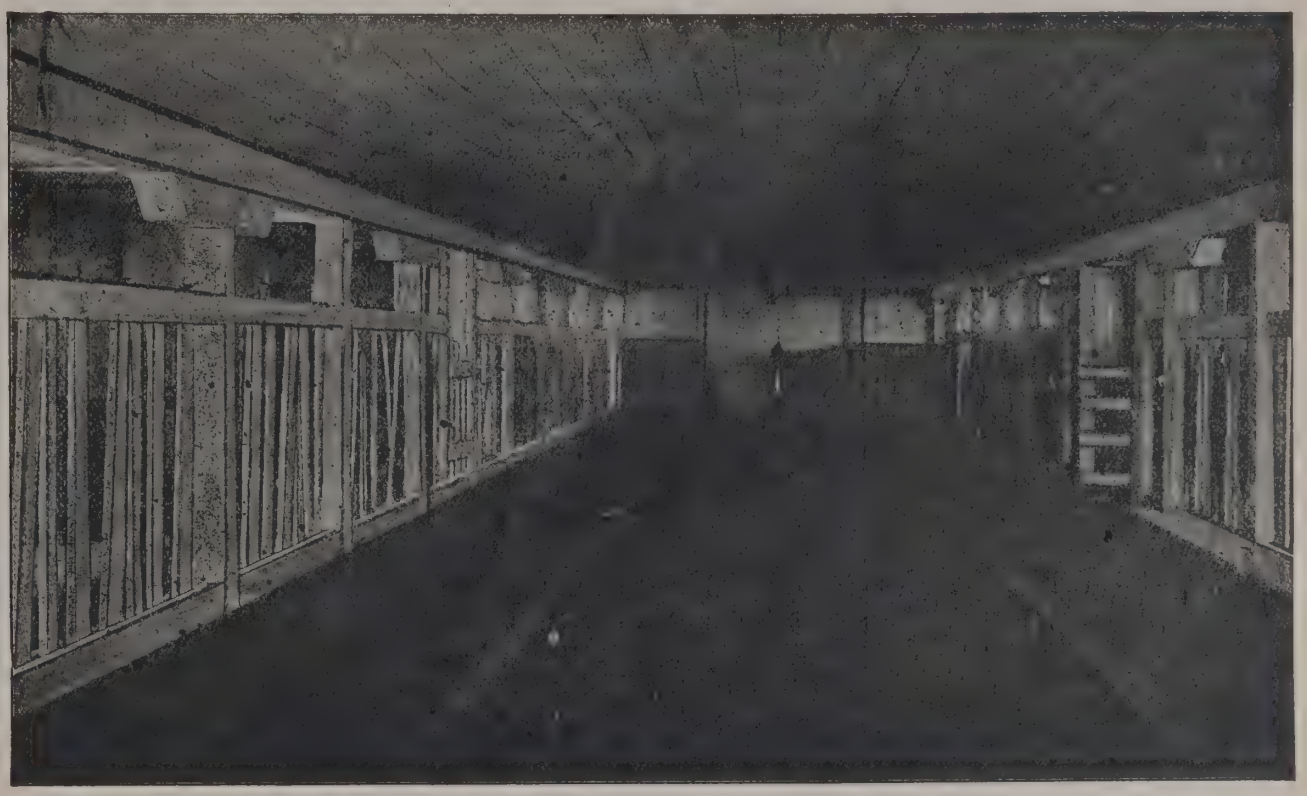
Second—The cow has a sympathetic nervous system, even as man has; and is just as subject to the effects of shock as humans are. A sudden fright of a pregnant human female will sometimes produce a miscarriage. A pregnant human female who witnesses a childbirth will, if of a highly nervous temperament be liable to a miscarriage. This is a known fact among physicians. Hence it is never safe to have them present. Now, let us apply a little of this reasoning right to the cow; or, rather, herd of cows.

One of them from some cause aborts. She is allowed to remain right in the herd with the other cows, and the result is that others abort from sympathy alone. This is one cause, then, that can be remedied by taking the aborting one from the herd and keeping her away as long as the placenta is retained and until other substances or fluids are got rid of. When a cow prematurely gives birth the placenta generally is retained and becomes more or less putrid. Some of the germs of putridity remain as a rule, and if she becomes pregnant again the membranes become diseased, and the result is another abortion. This is not sympathetic, but genuine germ abortion, and the bull that served her may have become infected and may carry the germs to other cows.

We thus see that we have two forms

abortion; yet both need treating on exactly the same lines. First, isolation of the aborting cow and quarantining her; second, the treating of her to prevent the germ that will develop and prove an infection in the herd. Take the first cow that aborts immediately from the herd. Procure a cattle syringe and daily irrigate the vagina and uterus with some germicide. Perhaps there is no better one than one made by mixing a tablespoonful of Creolin or the Jenner disinfecting fluid in three pints of warm water. Continue this until all uterine fluids cease, and then the cow will be liable to get in calf again and carry it full time, if properly cared for, and the disease is headed off in the herd.

Some are saying that it is heifers that have never been milked that are aborting. There are two general causes for this right along the lines already spoken of. The breeders of beef cattle have the habit of allowing the calves to run with cows or feed them excessively on fattening food, and the result is that they grow up with a dwarfed uterus or immature ones. They are sterile; or if they get in calf cannot carry it. One aborts; then the trouble begins. The breeders of dairy breeds are so afraid of milk and fattening foods that they raise the calves with a general weak vitality, and the uterus being the weakest organ in their body by inheritance, abortion follows from a trivial cause. Now, the prevention in these cases lies in the beef men rearing their calves on growing rations, and not fatten them from birth; and the milk or dairy cattle breeders not being so stingy of milk when their calves are young. Give them milk according to their needs, and oats and wheat bran. Grow them strong vitally, and then don't be afraid of oats and bran to keep them up until they become mothers. Also, give them exercise. I have not wondered, many a time, that heifers aborted when I have visited cattle raisers' barns and found calves shut up in dark, filthy pens, with corn meal to help themselves to; or else fed on a lot of wishwashy stuff, so that more milk could be sent to the factory. Feed the heifers well and give them exercise, and be sure it is a growing ration that you feed, and there will be far less abortion among them.



Thus, the whole treatment of abortion becomes one of food first; second, care in separating when one by chance aborts; and, third, the proper use of germicides and disinfectants. Just a word on that. When a calf is dropped in the stable or in the field, always take it entirely away from where any cow can see or smell it. Don't leave it in the field for cows to smell of, or throw it out on the manure heap; but dispose of it by burying or burning. Then, use the disinfectant spoken of on the place where it was dropped. Abortion can be prevented in the manner mentioned and headed off, but it means action, and immediate action, on the part of the one in charge of the herd. In short, no dilly-dally work will ever head it off. Neither will some man's powder or liquid to be put in salt or feed ever stop it.

This, in brief, is a general line to follow, when it appears. Stamping it out never will be done. It is here, and here to stay as long as we continue to breed good cattle for either beef or milk. The tree that produces the fruit, whether it be apple, pear, peach or plum, needs to be sprayed, and the animal that grows up to meet man's needs must be cared for and treated right on the same lines as that fruit tree. It must be made to grow. Then, when a germ attacks it, it must be treated, and the germ destroyed, or the business stops.

Dr. Smead's ideas of how to treat young heifers are sound and good. Not one-third of the young heifers in this great dairy state of Wisconsin are fed and nourished, as they ought to be, to make good cows. One of the best ways to diminish disease of all kinds in men and animals is to nourish the body well so it can resist disease. Last week we spoke at length on the "Care of Young Stock." It is a very important subject for every farmer to study and consider. There are thousands of farmers who never really feed anything well except their hogs. It is a good plan to keep all heifers that are in calf, separate from those that have not been bred, so as to avoid the danger that comes from riding those in heat. This often causes abortion in heifers.

THE *Dairy and Creamery* says there is one way to ascertain the value of a cow and that is by determining the amount of butter fat she will produce from a given amount of feed. Very true, but what will the *Dairy and Creamery* do with the farmer who has neither disposition or energy enough to make an effort to "ascertain." It may be said that the only way to drain flooded land is to ditch it, but what about the man who prefers to be flooded. We have had farmers ask us: "What will I do for cows to eat up my fodder?" when we have urged them to test their cows and turn off the poor ones.

IT is stated on good authority that the dairy idea has prevailed to such an extent in the Willamette Valley, Oregon, and other dairy districts in that state, that the prevailing type of cattle there are Jersey grades. It is generally the case that where farmers become imbued with dairy ideas and strive to reach the best perfection and profit in their business they soon see that one of the most important aids to such results is a cow bred for dairy purposes.

A sanitary cow stable. Floor kept clean, ceiled overhead and whole interior whitewashed.

While this stable is in bad condition it could be made sanitary at small expense by ceiling the interior to make a smooth and firm surface, whitewashing the same, putting in windows and ventilators and keeping clean.—Illinois Experiment Station Report.

Alfalfa for Pennsylvania.

ED. HOARD'S DAIRYMAN:—I have carefully read your paper for some time and am deriving much benefit from it. I wish to submit a few more alfalfa questions. I have a field of four acres which slopes to the southeast. It is steep enough that it makes good business for three horses to cut it with a binder. It has been cleared about thirty-five years; in that time it has raised eight or nine crops of wheat. The ground is broken in June, then cross plowed in August and top dressed with barn-yard manure, after which it is seeded to wheat; in the spring seeded with clover and timothy. It is then mowed two or three times and then the process has been repeated. The yield has varied from twelve to thirty bushels to the acre.

My plan is this: To plow this field for potatoes and give clean cultivation to get rid of weeds. The following spring plow and seed to alfalfa. What I wish to know is this. Will this field raise alfalfa? I would be willing to spend $50 per acre to get alfalfa started on this field if I could know it would grow successfully. What analysis of fertilizer and about what quantity would be a liberal application. Will ground lime sown after the fertilizer has been sowed be of any benefit?

In an alfalfa article some time ago you say tile is not suitable to drain a field for alfalfa. How would you drain it? By plowing in narrow back furrows or how?

West Franklin, Pa. L. C. B.

The probabilities are that if red clover flourishes on the piece of land referred to, that the soil is already inoculated with the nitrogen gathering bacteria, which are so essential to profitable production of alfalfa. We are aware that in saying this, we are not in accord with statements put forth by some of the experiment stations—notably, that of Illinois—but our personal experience justifies the statement. As to the proper fertilizer to use, see the article on page 628, and if there is not now some considerable lime in the soil, the addition of lime, applied as suggested, after the fertilizer has been sown, will be altogether in order.

Alfalfa is such a deep rooted plant that it would soon find its way into the drain tiles and effectually clog them up. Further than this, land which is not fairly well drained naturally, is hardly appropriate for alfalfa. Surface water could be removed by very shallow open ditches made by back furrowing as suggested.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Suggestions for an Iowa Ration.

What will be the best ration for cows having only shredded fodder for roughage unless it be a little oat straw occasionally? Have watched your columns since I commenced taking your paper in Jan., but have seen no rations that fit my situation. I have to buy all my concentrates but corn, so wish to know which is the best and cheapest of the following: oats testing 26 pounds at 28 cents per bu.; bran, $17 a ton: oil cake, $26 a ton, shorts $20. Haven't a price on gluten feed yet, but you could tell what I should buy it for to be better than oats or bran. Also, I may be able to get some barley at about 40 cents. If so would you use some of that? Would like a ration to use that and one without so I will know what to buy and in what proportion soon. About how much roughage and how much grain per day should a 900-lb. cow have?

Am testing my cows and trying to get them up to 300 pounds a year, but will not this first year, but am getting more from nine this summer than I did last year from 15, and 6 of them are the same cows I had then. J. D. M.

Janesville, Iowa.

We take it that "shredded fodder" means shredded corn stalks, which is corn stover. With this shredded stover as the principle item of roughage, we think it would pay to feed, especially to cows freshening this fall or early winter, from one to two pounds of oil meal daily. This oil meal not only furnishes a high percentage of protein, which is needed with the corn stover, but it has a dietetic effect, aids in the digestion of the other feeds, and is, therefore, especially indicated in cases like the present. Just what other grains to feed is more of a problem. Bran at $17 per ton is considerably cheaper than oats weighing 26 pounds and costing $.28 per bushel. Gluten feed is always in order for milch cows; so are brewers dried grains, Atlas gluten meal and malt sprouts. It hardly becomes us to express an opinion as to what these various feeds should be sold for. Prices are governed largely by the demand and supply. Two pounds of oil meal, two pounds of gluten feed and four pounds of bran would make a very fair allowance of grain for almost any cow. In addition, give her what of the shredded stover she would want and the probabilities are that this would make a fair average for a herd. Some might require more grain. In that event, if prices warranted it, some corn meal could be added, say two pounds, or the bran or the gluten feed increased or brewers grains added.

If the cows freshened last spring, they will require much less grain during the winter, because they will give less milk; but after all, the amount of grain to be fed must depend largely upon the judgment of the feeder. Let the cows have what they will pay for, but do not feed them so much as to get them over fat.

A matter too often overlooked is a failure to give the cows salt in proper amount and at proper times. The ideal way is to give them salt twice a day, with each feeding of grain, a good heaping teaspoonful. There is no more reason why a cow should be salted only once a week or why she should be expected to go to a trough to help herself than it is for a man or woman to take their salt in a similar way, and not with the food as they eat it.

Cost of Cement Silos.

I would like you to find out from some of the farmers that have written your paper about cement silos, how much it costs to build them, and publish in your paper. C. D. S.

Dousman, Wis.

If any of our readers who have built cement silos can give information as to the cost, we shall be very glad to publish it. Meantime, we may quote from Prof. King's "Physics of Agriculture:"—"The cost of the material for laying 100 square feet of concrete floor, four inches thick, with ½ inch of facing is: crushed rock, or in its absence, coarse gravel and plaster sand 1.23 cubic yards $0.984, sand and gravel .73 cubic yards $.365, cement 376 pounds $3.76, total $5.109."

When to Harvest Corn for Silage?

I sowed Salzer's Superior corn, and now intend siloing it. Owing to drouth in June was set back considerable, and has hardly started to tassle. Our corn season here is short and will expect frosts by Sept. 10. Will it be fit for silage at this stage or week later? We read in the DAIRYMAN that corn must be fairly turned before cutting, but this shows no sign as yet. As we are greenhorns we would thank you in advance for information. C. M.

Wausau, Wis.

As stated in another column of last issue, the editors will prefer to let their corn get frosted rather than harvest it for the silo before the ears are fairly well filled and matured. Indeed, so far as our present knowledge of the subject extends, a pretty severe frost improves the quality of unripe or immature corn for silage. There will, of course, be some loss of leaves in the frosted corn, but this is more than compensated for by the improved condition of the stalk and ear.

Paint for Inside of Silo.

Please give me information of a cheap paint or filler for the inside of a silo. A. K.

Rockville, Conn.

It is something of a question whether it is desirable to paint the inside of the silo, but assuming that it is, there is probably no better preparation than coal tar, and the best way to put this on is to reduce the tar with gasoline sufficiently so that it will work fairly well under the brush. It should not be forgotten that the gasoline vaporizes very easily, and hence, when using it, care should be taken not to bring lighted matches or light or fire of any kind near it.

Arresting Horn Growth.

I called at several of our dairy supply stores for a preparation to prevent the horns from growing on a heifer. They told me to write and ask you, as you would give me some valuable and immediate information. The calf is now two months of age, and if you can tell me what to use, as I have been told you would, I will be eternally grateful. M. W.

Palms, California.

There are various chemical dehorners on the market, and some of these, notably March's, have been advertised in our columns. In the absence of these, many persons use caustic potash, to be had at almost any drug store in small sticks about the size of a lead pencil. The chemical preparations, as well as the caustic potash, are recommended to be used when the calves are from a week to ten days or two weeks old, before the budding horn has attained very much development. Whether the potash will kill the horns on calves that are two months or more old, we are unable to say, but it may perhaps be worth while trying. Clip off the hair above the budding horn, wrap some paper about the caustic potash, dip the end in water, and rub it thoroughly several times just over the horn. This, of course, will develop a sore spot which will need some attention, but will heal in ten days or two weeks, and if successful, leave a clearly polled head.

Seeding to Alfalfa in New York.

In Central New York, when, and whether alone or with some other crop, should alfalfa be sown? If with another crop, what is best? SUBSCRIBER.

Auburn, N Y.

In seasons like the present in Wisconsin, where we have had an excess of rain all summer and the soil is thoroughly saturated, it might do to seed alfalfa in the late summer or early fall, but in ordinary seasons it would be a doubtful experiment in our opinion, because the young plants would not acquire sufficient growth and maturity to withstand the winter.

Where land is not reasonably free from weeds, we have considered it advisable to seed alfalfa with some quick growing nurse crop, and as a rule would prefer barley, although we have always used oats. We have some loss this year with the nurse crop growing too large

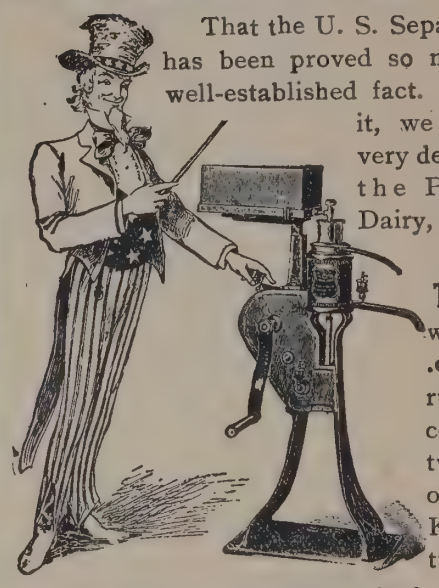
DOCTOR SAID

"Quit Wrong Food and Eat Grape-Nuts."



An Illinoisan who has been through the mill says: "Last spring I was so bad with indigestion I could not digest even soft cooked eggs and doctor said I must eat predigested food and prescribed Grape-Nuts. I changed for the better before I had used one package, eating it three times a day.

"My improvement on Grape-Nuts food was so wonderful that I concluded to use your food drink Postum in place of tea and to make a long story short I have not been without Grape-Nuts and Postum since and my present health proves my doctor's wisdom in prescribing Grape-Nuts. I have got strong as a horse and well and I owe it all to your delicious food and Postum." Name given by Postum Co., Battle Creek, Mich.

In the making of Grape-Nuts food all the indigestible starches of the grain are transformed into Post sugar. Every particle of Grape-Nuts is digestible in the weakest stomach. Physicians have never found a stomach too weak to digest and assimilate it.

Look in each package for a copy of the famous little book, "The Road to Wellville."

THE U. S. LEADS THE WORLD

That the U. S. Separator leads all others has been proved so many times that it is a well-established fact. To those who doubt it, we call attention to two very decisive victories: one at the Pan-American Model Dairy, where

THE U. S. WON THE WORLD'S RECORD

with the average test of **.0138** for **50** consecutive runs; the other the recent competitive test between six different makes of separators at the Kansas State Agricultural College, where

The U. S. Excelled All Others

in the tests of skim milk and total minimum loss, according to Press Bulletin No. 123.

For reports of many other victories, write for catalogues.

The U. S. is the Safest and Most Durable,

the gears being entirely enclosed in iron casting, making it impossible for anyone to get caught in them and injured. Don't overlook this point in buying a separator.

We have the following transfer points: Chicago, La Crosse, Minneapolis, Omaha, Sioux City, Montreal, Quebec, Sherbrooke, P. Q., Hamilton, Ont.

JUST THE THING

STAR BOTTLE WASHING AND RINSING OUTFITS

Write Us About This.

STAR MILK COOLER CO., HADDONFIELD, N. J.

EASY. It is easy to go on losing money by taking care of milk in the old way, that is, by not taking care of it: But it is easy, too, to take proper care of your milk with a

Champion Milk Cooler-Aerator

The Champion is pre-eminently the easy Cooler—easy to buy, easy to take care of, easy to use.

A Booklet for the asking.

Champion Milk Cooler Co.,
67 Main Street, CORTLAND, N. Y.

and lodging so badly as to smother the young alfalfa. If we had cut the nurse crop before it went down so flat and had taken it off the ground immediately, all would have been well.

Not a Good Way to Build a Silo.

I am about to erect a silo 20 x 20, by 30 ft. high and expect to build it on a stone foundation with 2 x 4 scantling laid flat one upon another, with an overlap of ¾ of an inch with every alternate one, which will answer as a groove to hold the cement, which I will put on the inside. Would you advise me to cement on wood, will it stick and last?

I am a subscriber of your valuable paper, which is O. K. I read so much about silos in your paper, so I concluded to build me one and try this new way on the plan of the grain elevators.

Have just started a dairy with 40 cows. The silo is something new for this part of the country Helena, Montana. S. R. T.

We are of the opinion that a silo 20 feet square built in the manner proposed would not be a success, as the sides would not withstand the great pressure, and it it is doubtful if the over-lapping and retreating 2 x 4s would furnish a sufficient hold for the cement. An eight sided silo built up with 2 x 4s, laid flatwise and crossing and interlocking at the corners would probably be strong enough to resist the great pressure. Then, by furring out on the inside with thin strips and lathing on these, a lining of cement plaster would probably hold. Common lath would answer for these strips.

Basement for Pigs and Manure.

Have a barn 40x50 ft and a basement under one end of it 30x40 ft. I now have my cows in the basement. What objection would there be, if any, in putting the cows on the floor above the basement, and have the basement for a pig room and manure cellar?

Could cement floors be placed on the wooden floors? H. A. G.
Bristol, Ill.

Do the best one can, a manure cellar under a stable cannot be kept in a cleanly or sanitary condition, and a manure pile, either in a basement or elsewhere, is not a fit place for swine. All things considered, it is almost universal judgment that the best way to dispose of manure is to haul it out and spread it on the ground daily, or as often as circumstances will permit. This is not only a great saving in labor, but it enables one to get the manure where it is wanted at a time of year when other matters are not pressing.

It is extremely doubtful if cement floors would be successful if laid on floor supported by joists.

Feed for Horses.

Could you feed peas and oats fodder as a substitute or part substitute for boughten oats, to horses, or is there less nourishment when the oats are in milk?

Also with plenty of good grass, oats, oats and peas and corn fodder, if the weather is only warm, what grain would you add to make a balanced ration. R. A.
Winsted, Conn.

Peas and oats fodder makes, a very acceptable roughage for horses, but horses at work can hardly get along on roughage alone. They need some grain of some kind, not necessarily oats.

With the feeds named, we would use such kind or combination of grains as we could buy cheapest, when the amount of digestible nutrients contained in each variety is considered. Corn, barley, wheat, and almost any of the by-products, make very acceptable feed for horses at moderate work.

Sowing Barley for Silage—Disinfecting a Bull.

Can I sow barley now, with the hope of putting it the silo and making good ensilage, either mixed with a little corn and soy bean, or alone?

Have been troubled with contagious abortion the past winter and wish to breed some of the cows again. How should the bull be disinfected so there will be no chance of his carrying possible germs to other cows. J. H. W.
Fitchburg, Mass.

We do not think it would be expedient to attempt to make silage of barley at any time, certainly not by sowing it as late as August. Under favorable conditions, it might be possible perhaps to make a moderate crop of barley hay from barley sown early in August, but hollow stemmed grains do not appear to keep well in the silo.

A bull can be disinfected by using a two ounce hard rubber syringe and injecting your disinfecting solution into the sheath before and after serving.

The solution must not be as strong as ordinarily used. A 1 to 5000 solution of bichloride of mercury is sufficient.

"Yield" and "Overrun."

Please tell me through your valuable paper how to find the "yield" of a creamery for a month; also the "overrun" A READER.
Lake Crystal, Minn.

We know of no other way of finding the actual yield of a creamery except to put the butter on accurate scales and weigh it up; and the over-run will be the difference between the amount of fat in milk and the total weight of the butter.

This over-run will vary from day-to-day in the same creamery, and more or less in different creameries, partly because buttermakers are not as careful and exact and honest as they should be in making and reporting the tests, and partly because butter itself varies in the amount of fat it carries.

Patterning after results obtained in the ninety days' contest at the World's Fair in Chicago, where the best machinery was used and the most expert buttermakers employed, the Association of Agricultural Chemists, after full consideration, came to the conclusion that in testing cows and estimating the amount of butter, one-sixth might reasonably be added to the fat. In other words, under the best conditions, standard commercial butter may exceed the total fat by 16⅔%. It will be very difficult indeed for the average creamery to obtain such an over-run as this, for the reason that the milk, as they receive it is not always in the best condition, and oftentimes the separators and churns are not doing their very best work. It is our opinion that a creamery making an average over-run of 12½% throughout the year is doing about as well as ought to be expected.

The N. C. B. Assn. Meeting Postponed Until 1904.

ED. HOARD'S DAIRYMAN:—After having made a thorough canvass of the situation, the Executive Committee of the of the N. C. B. Assn., has come to the conclusion, that it will be to the interest of all concerned to abandon the Convention of 1903, and to convene same at St. Louis, Mo., Oct. 20 to 27, 1904.

In coming to this decision, the committee wishes to express their appreciation of the liberal offer made by Citizens' Business League of Sioux Falls, and feel that at the earliest opportunity they should be recognized as being entitled to a meeting of the Association in Convention in their city.

The Committee has further decided to complete the six months educational tests. The participants will receive pay for their 6th exhibit, and the championship cup will be awarded to the winner when tests are completed.

The committee further orders that a special diploma be awarded to all those participating in the 6 months tests, having an average score of 92 or above.

By order of Excutive Committee,
E. SUDENDORF, Sec'y.
N. C. B. Assn.

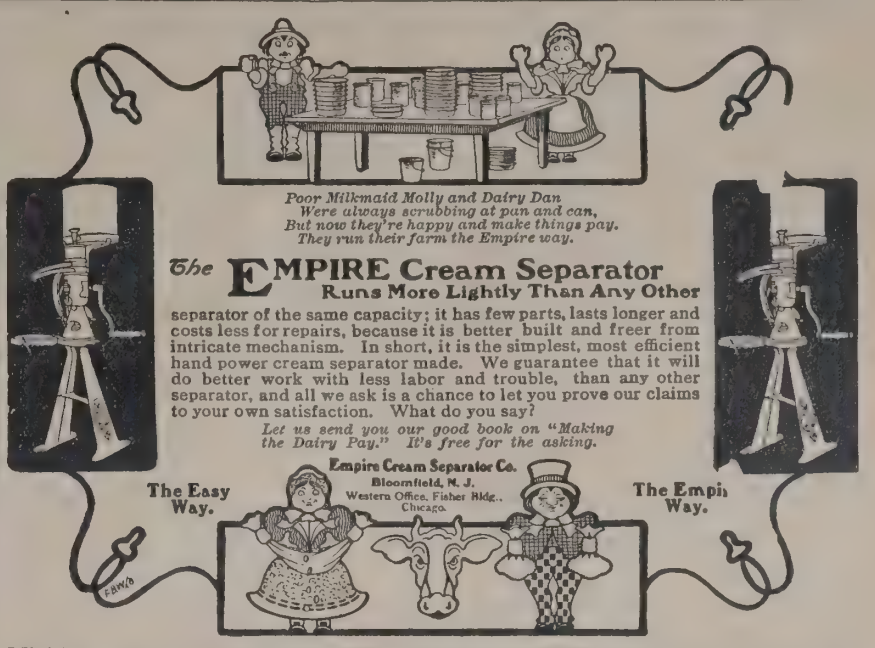
TRIP THAT PAID.

Ten Miles to Get a Package of Postum.



Some sufferers won't turn over a hand to help themselves but there are others to whom health is worth something. A German woman living in the country made a 10-mile trip to get a package of Postum. She was well repaid, for it brought health and happiness in return.

A translation of the good frau's letter says: "From a child I had been used to drinkiug coffee, daily, but the longer I continued drinking it, the worse I felt, I suffered with heart trouble, headaches and dizziness. Then I had such an uneasy feeling around my heart that I often thought death to be near.

"I gave up drinking coffee and tried hot water, but that did not taste good, and I did not get well. Then I read some letters from people who had been helped by Postum Food Coffee, and I determined to try it."

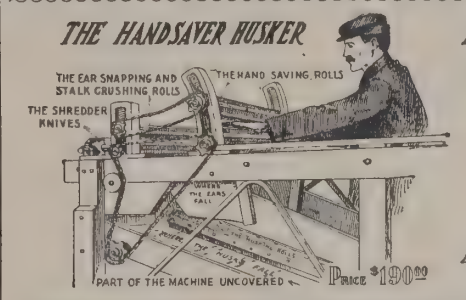
"I had to go 10 miles, to get a package but I went. I prepared it carefully according to directions and we have used it now in our family for nearly two years, drinking it twice a day. It agrees well with all of us. My heart and bowel troubles slowly but surely disappeared, it is seldom that I ever have a headache, my nerves are steady and strong again and I am otherwise strong and well. My husband has been lately cured of his sick headaches since we threw coffee out of our home and have used Postum. Name furnished by Postum Co., Battle Creek, Mich.

Look in each package for a copy of the famous little book, "The Road to Wellville."

Did You Ever Keep a Record Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want." We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at following prices:

Price 5c Each	6 for 20c	12 for 30c	25 for 50c



SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—On account of Labor Day falling on Monday, President Newman advised the members to hold the weekly session on Saturday.

The Quotation Committee reported the official market firm at 19½ cents.

Offerings.	*Tubs.*	*Amount asked.*
Winslow	50	20
Orangeville	20	20
Baileyville	20	20

There were no sales. Former markets:

	Sold.	*Price.*
August 31, 1903	210	19¼
Sept. 8, 1902	0	20
Sept. 9, 1901	0	20
Sept. 10, 1900	0	20⅛
Sept. 5, 1899	111	21

The New York market is 20 cents, with receipts of 6,767 tubs.

The output for the Elgin district was 712,776 pounds. H. C. B.

Elgin, Ill., Sept. 5.

Sales of Good Dairy Cows.

ED. HOARD'S DAIRYMAN:—Does it pay to breed and raise good dairy cows? I should say that it does, and Jefferson county, Wis., is the place to find the men who know how to produce such cows, and the place to find the cows as well. In proof of which I submit the following:

Last week there came to Fort Atkinson, this county, from old Mexico, a man with a name unpronounceable by the average American, who wanted to buy *good dairy cows*. Thoroughbred Holsteins were the kind he wanted. He could not talk English, so had with him an interpreter. He secured the services of James Wilson, of Fort Atkinson, who knows where to look for the best stock, and together they went to Lake Mills, 12 miles distant, where they bought 18 cows of Wm. Everson, 6 of them two-year-old heifers, which had not come in, for the nice sum of $3,000, an average of $166.66 each. They then went to the farm of F. B. Fargo near by where they bought 11 cows and two calves, one a bull and one a heifer less than a year old, for $2,250, an average of $173 each. They next visited W. R. Gates of the adjoining town of Oakland, and of him obtained 8 head—5 cows, two young heifers and a young bull for $950.

These results were obtained through the exercise of skill and judgment through many generations in breeding, and proper care in feeding and handling the animals, and not by haphazard, go-as-you-please, or one-bull-is-as-good-as-another method which too many farmers practice

These are not the only cows that have been sold for high prices in Jefferson county, but I have only mentioned these recent sales to remind farmers that it pays to raise good stock—that which is best adapted to the purpose for which they are to be used.

I might also mention that this particular breed is not the only breed of good dairy cows to be found in this county. Cows of other dairy breeds have been sold here, not very long since, at equally high prices, and there are plenty of them to be found now, so that one wishing to buy can find the kind he thinks best adapted to his purpose, or the breed to which he takes a fancy.

These cows were not purchased because of any merely fancy points or "show" qualities, but because of their undoubted value for a working dairy, and the probable ability of transmitting these valuable qualities to their progeny.

A few years ago I stopped over night with this same Wm. Everson of Lake Mills. He then had 40 cows. They were fine ones and heavy milkers though they were not, at that time, bred up to the high standard of his present herd. I observed then that he was a good feeder, fed a well balanced ration, and fed each cow in accordance to her ability to turn her food into milk. He provided his cows with succulent food in the form of corn silage.

In the evening, a check was brought to him in payment for the milk he had delivered to the creamery during the previous month. The amount was $345 for the milk of 40 cows one month. Besides this he had had the skim milk which had been the main feed of a bunch of splendid calves and a goodly lot of pigs.

Surely, it does pay to keep, well feed and well care for *good* dairy cows, even if one has to pay high prices for them to begin with. But it does not pay a dairyman to keep and milk poor scrub cows even if they can be bought for almost nothing. C. P. GOODRICH.

Fort Atkinson, Wis.

CONCERNING OUR ADVERTISERS.

Our readers desiring to buy a gasoline engine will do well to read the advertisement in our columns of the Temple Pump Co., Chicago, and their "Master Workman."

People who are looking for a breed of good milk and butter producing cows should read the ad. "A Rare Chance" on page 696.

An event of large interest to Holstein breeders is announced in the auction advertisement of Mr. John C. Godfrey the noted breeder of Holstein cattle. The advertisement will be found on another page and contains mention of some of the choicest cattle from three eminent breeds. It will be well for our Holstein friends to consult the advertisement.

Ruling on large 9½c; ruling on small and general, 9¾c. Butter, 30 packages at 20c; 12 at 21c; 25 at 21½c; 600 1 lb. prints at 22c. Curb sales of cheese 500 large at 9¾@9⅞c; 250 at 10c; small 1,400 at 10c; large will soon be worth more than small, so few are being made.

NEW YORK MARKET.

NEW YORK, Sept. 5—Butter—Receipts for the week, 49,226 packages.
Exports for the week, 67 packages.
Extra fresh Creamery butter was in good demand and sold up clean at 20 to 20½c, and at the close there is every indication of advanced prices for this style butter. Firsts were readily picked up at 19 to 19½c and good sound creameries were inquired for at 18@18½c. Dairy butter is hardly in quantity enough to quote; few tubs fancy sold at 19 to 20c. About all the arrivals were poor to good stock in all sizes and kinds of packages and they sold to packers at 14 to 16c. Ladle butter is quite but holders are firm and insist on outside prices for desirable lots. Renovated dull and nominal. We quote:
Creamery, extra, 20@20¼c: medium, 19@19¾c; poor, 15@18c; Dairy, extra, 19@19¼c; medium, 16@18c; poor, 14@15c.
Cheese—Receipts for the week, 31,363 boxes. Exports, 8,530 boxes
The market is active and strong and sales were reported this week up to 11c for fancy large sized cheese. Small cheese were more plentiful and 10¼c was about top for best goods. Skimmed cheese showed more life and sold freely for export at 5 to 7c, while house trade took finest qualities at 8 to 9c. We quote:
Full Cream, large, extra, 11c; medium, 10@10¾c poor, 7@9c. Full cream, small, extra, 10¼c; medium, 10@10¼c; poor, 7@9c.
Eggs—Receipts for the week, 45,321 cases.
Strictly fresh stock very scarce and wanted. All grades are doing better and it begins to look as though all the ice house stock would be wanted at full prices. We quote:
New York & Penn., strictly fresh, per dozen, 24@25c; Northern & Western, strictly fresh, 22@23c; all Sections, poor to good, 15@21c.

BALTIMORE MARKET.

BALTIMORE, Md., Sept. 3—Butter—There is no change of importance to note in the market; the conditions are about the same as noted in our last report. Extras, contrary to expectations, continue in fairly liberal receipt. Speculators have been quite prominent on the market, and all long lines of high scoring stock have met quick sale; and in several instances a slight premium over our top quotations has been obtained. The demand for local consumption continues very good while firsts continue in moderate receipt, the supply is about equal the requirements. Imitation Creamery—So far this week have been in very light receipt, all attractive offerings met prompt sale. Ladles—The offerings are fully equal to, if not in excess of the demand. Packing stock is in reduced supply; there is quick sale awaiting all fresh sweet arrivals. Blocks and Prints—for the time being are in ample supply for the requirements. At the close of today's market, there was quite a healthy feeling prevailing and receivers were firm in their views.
Creamery Separator, extras 20@20½c; firsts 18½@19½c; seconds, 16@18c. Imitation Creamery, extras, 18c; firsts, 17c; seconds, 14@16c. Creamery blocks (2-lb.) extras, 21@22c; firsts 20c; seconds, 17@18c. Iowa & N. W. Ladle, extras, 16c½; firsts, 15½c; seconds, 13c. Creamery prints (¼ lb) extras, 22@23c; firsts, 21c; seconds, 17@19c. Md. Va., & Penn. Prints, extras, 20@21c: firsts, 19c; seconds, 16@18c.
Eggs—There is very little if any change to note in the condition of the egg market since our last issue. There is a continued scarcity of strictly fresh stock, and for this kind there is a quick demand at 22 cents. All defective stock is slighted; in several instances, owing to the light supply of desirable eggs, storage stock had to be drawn upon in order to satisfy the demand.

Cheese—Receipts ample; demand moderate; market rules steady to firm.

N. Y. State—Cheddars, fine, 10¾@11c; choice, 10¼@10½c; fair, 9@9¼c, Flats, fine, 10¾@11c; choice, 10¼@10½c; fair, 9@9½c; Small, fine, 11@11¼c; choice, 10½@10¾c: fair, 9½@10c; Ohio Flats, fine, 9¾@10c; choice, 9@9¼c; fair, 8¼@8½c; O. Excursion Rates at County Fair at Fond du Lac, Wis.—Via the North-Western Line. Excursion tickets will be sold at reduced rates Sept. 14 to 18, inclusive, limited to return until Sept. 19, inclusive. Apply to agents Chicago & North-Western R'y.

Returns from Two New York Dairies.

ED. HOARD'S DAIRYMAN:—The accompanying tables, which I have prepared directly from the milk bills of the two dairies represented by them, will, it seems to me, afford a valuable object lesson for all who are interested in the study of the dairy business in its various phases.

For not only will they show the benefits derived from co-operative dairy management as proven in this dairying region, but at the same time a comparison of the two tables shows a considerable difference in results, particularly in the matter of milk yield and average returns per cow for the same year in the two dairies. This of course is due to the difference in the butter fat test and has, no doubt, been brought about largely by difference in breeding, as the milk in both instances was as I am credibly informed, whole milk just as milked from the dairy, no cream in either case having been taken from one portion of the milk and added to another. The test of Mr. Van Dyke's dairy for the year is certainly a remarkable one and since its publication recently in some of our local papers, has drawn out a great deal of comment, but it shows what may be done by careful breeding along the line of increased butter production in even a large dairy.

Mr. Van Dyke has for many years been breeding with reference to building up a first-class butter dairy, of high grade Jerseys, believing that such a dairy will return better profits, than one producing more milk but of inferior quality, in the long run where the milk is made up as it is here—both Mr. Thompson and Mr. Van Dyke are patrons of the Delhi Co-operative Dairy Company's creamery, a statement of the past year's work of which was recently given in your paper—on the butter fat basis.

On the other hand Mr. Thompson believes it pays him better to breed more particularly with reference to increased size and vigor, and incidentally to a larger milk production, rather than to the largest possible butter fat yield from his dairy, which is also composed of grade Jerseys, but of a somewhat different type, he having for several years been selecting and breeding for size and yield even if to secure these, he is obliged to sacrifice something in the per cent of butter fat.

As will be seen by reference to the table, he has succeeded in securing an average milk yield, per cow, of 674 pounds above that of Mr. Van Dyke, with an apparent gain of $3.27 per cow, in favor of Mr. Thompson, in average returns.

It would be interesting to know the cost of production in either dairy, thus showing the real gain in profit of one over the other, but I was given no data to ascertain this even approximately.

Delaware Co., N. Y. J. E. BROWNELL.

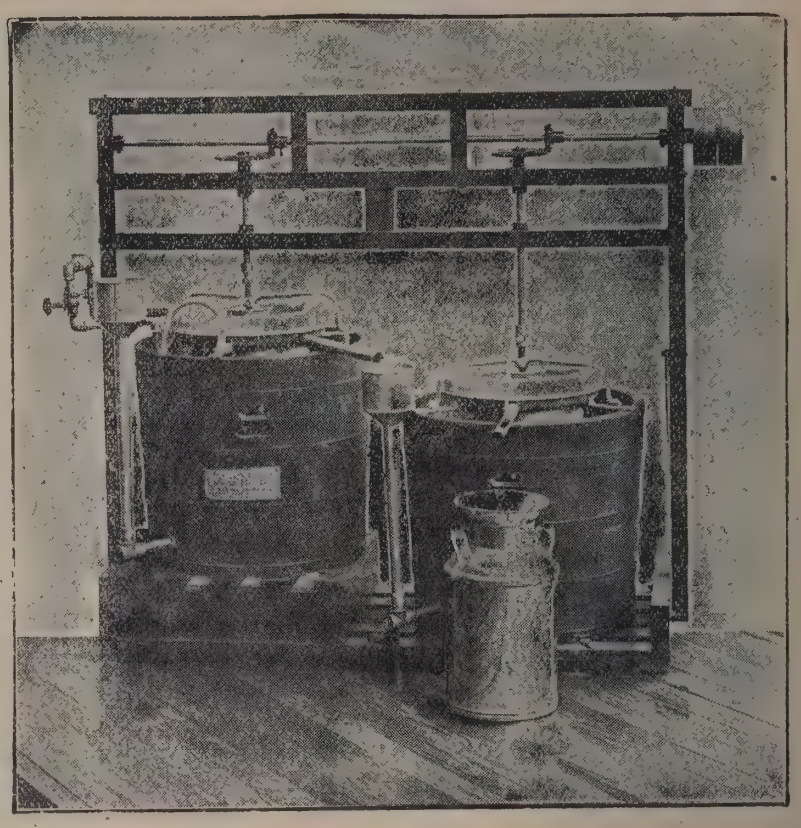
Mr. Wheaton's Canadian Dairy Notes.



Shipping Too Green Cheese—Price of Cheese—Developing the Butter Trade—Dairy School Announcements.

ED. HOARD'S DAIRYMAN:—Again our dairymen have the charge made against them of shipping cheese too green. The complaint comes from Great Britain through our agent of the Canadian Department of Agriculture, who is looking after the market side of agriculture in the old land. So serious is this complaint that there is a danger of its injuring very materially the good reputation of Canadian cheese across the water.

There were similar complaints last year and one would think the matter had been ventilated enough at last winter's dairy conventions to prevent a recurrence of the practice this year. But for a little present gain, the practice is kept up by not a few factories, who seemingly are not at all concerned about the reputation of our cheese abroad, or with its effect upon future trade.

The blame may be said to rest upon both buyer and seller alike. The former will buy and ship this immature product for the purpose of present gain, and the latter will sell frequently ahead of time on a falling market, and with the hope of gaining a little because of less shrinkage in weight. But whatever the gain, there is no good reason whatever for continu-

A GREAT SUCCESS.

The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

Truth to Tell

There are no other milk cans made that can equal in wearing qualities the genuine

BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned. Remember, the Buhl is the only can in the world that is made with the Buhl "Victor" Can Breast and the Buhl "Victor" Round Handle. As there are many inferior imitations of this can, we stamp all ours with the Milk Can Trade Mark. Look for it. Sold by all live dealers. Ask about them, or write us direct.

BUHL STAMPING COMPANY,
212 W. Larned St., Detroit, Michigan.

ing the practice. In the long run, someone has to suffer and the loss will eventually come back to the patron.

In any case, the practice is a vicious one. If cheese is not sufficiently cured at the factories before shipment, it has no chance for properly curing after leaving the curing room and therefore reaches the consumer in an immature state, with its quality impaired and lacking that fine flavor characteristic of well cured cheese. Besides, bad flavors may develop after leaving the factories that could not be detected in the green stage. This may also be a reason for shipping green from factories where bad flavors are common.

But whether good or bad flavors develop afterwards, all cheese should be kept until sufficiently cured before being shipped. Patrons of factories should insist upon this being done. It is in their interests to do so as any loss, present or future, will come out of their pocket.

It is somewhat surprising how the price of cheese keeps up this season. Only once, and that for a few days, has it been near the nine cent point. This week's quotations at the local dairy boards of trade in this province are ruling 5 above the 10c point; a very good price for August quality. The market is reported firm, and stocks on this side are light. Factorymen were never sold up closer at this season, which may account somewhat for the large quantities of cheese shipped green.

At these prices for cheese it is little wonder that the butter side of dairying is receiving scant attention. "Cheese is king" and the butter manufacturer may rest satisfied if he can hold a fair proportion of his former patrons. This, he is finding it difficult to do, especially, where there are cheese factories in operation in the neighborhood.

But the "boom" in cheese is not the only thing working against the extension of the butter industry. The action of that dairy conference at Montreal last spring, in proscribing butter made by the cream gathering system and the determination which certain exporters are showing, to prevent butter being made by any other plan than the factory separator system, has also had this effect. Many of our dairymen are largely engaged in swine raising and rearing young stock and know the value of skim milk for feeding purposes when fed in a sweet condition. The factory separator plan, in this country at least, has not been managed in a way that would give the best results to the patron who wishes to utilize the skim milk to advantage for feeding purposes. As a rule it is returned sour and with a large amount of its feeding value gone. Factory managers are to blame for this and they should not complain if patrons prefer to do their own skimming and retain the skim milk at home.

In developing our butter trade, the farmer's side deserves some consideration. In conversation with a prominent dairyman the other day, he stated that he would not patronize a creamery at all unless he were allowed to do his own skimming at home.

The direct cash returns as between cheese and butter were so far apart that unless one were able to make the very most out of the skim milk, the latter could not compare with the former in point of profit for the farmer. He stated that he had tried sending milk to a separator creamery, but had not been able to get his skim milk home in a satisfactory condition.

There are, no doubt, many others who have had similar experiences, and whose wishes must be given some consideration, if our butter-making industry is to be largely extended. There is also the question of haulage, which is much less in the case of the cream gathering as compared with that of the cream separator factory.

We have no desire to disparage the value of the factory separator system in the making of the finest butter. Probably, all things considered, and taking one factory with another, a more uniform quality of butter can be made by this system than by the cream gathering plan. But with the patron, quality is not everything, and unless it carries with it a sufficiently increased price to pay him for what he loses in the way of extra haulage and inferior skim milk returned, he will not be influenced much by it.

If it were an impossibility to get good butter by the cream gathering plan, arguments against it would have more weight. But it has been shown that where properly managed, even where the farm separator is not in use, good butter can be made, and consequently there is no excuse for this general condemnation of the system, because some few concerns have been badly managed. As a patron told us recently, he could look after the cream a good deal better and a great deal easier than the whole milk. A little education of the cream gathering patron would go a long way towards improving the quality of the cream.

There is no need, perhaps, of pursuing this question further. Time will, we think, show that if the butter-making industry is to be largely extended in many parts of Canada, the cream gathering plan must be pushed forward rather than retarded. However, cheese seems to be in the ascendant just now, and it may be that neither system will make much headway, till the tide turns.

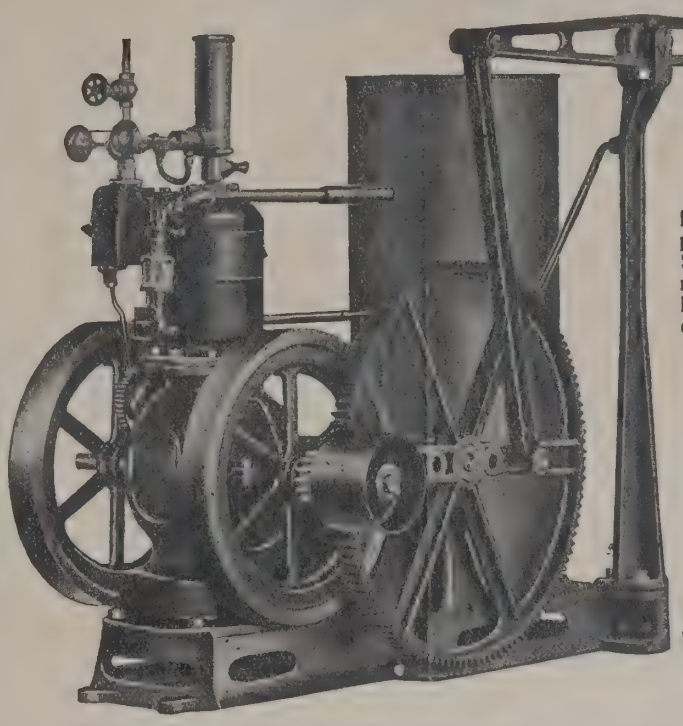
There is a little better feeling in the creamery butter market just now and the demand for export is much stronger, chiefly for fine saltless creamery and for choice, light salted. The ruling figure is about 19 cents, which as compared with 10 cents for cheese, is not very encouraging for the butter maker. The flow of milk is good for this season of the year and a large fall make of cheese and butter is assured.

The dairy school announcements are out. In our last letter we stated that the Strathroy school would open on Dec. 1st. The provincial school at Guelph will open about the same time under the direction of Professor Dean. A fine series of courses is provided; a creamery course in December for those preparing for winter butter making; a regular course for cheese and buttermakers and a home dairy course beginning early in January and continuing till the end of March; a short course for dairy instructors in April, and a summer course for makers following. All this gives ample opportunity to makers to keep up-to-date in their methods and work.

Prof. J. W. Hart, who for several years has had charge of the Kingston Dairy School, has resigned to accept a position at the Illinois Agricultural College. The Illinois College will secure a painstaking and energetic official who has had a wide and varied experience in dairying, especially the butter-making side of it. His successor has not been appointed yet but it is probable that a well qualified dairyman, a former member of Prof. Robertson's staff will receive the appointment. If so, the Kingston School will have another period of successful educational work before it.

Much interest is being taken in the dairy exhibits at the Toronto Industrial Fair this year. A couple of valuable prizes are to be given to the syndicate instructor of the factories whose districts take the most prizes. There are other classes for the makers as well. J. W. WHEATON.

Toronto, Canada.



GOOD INTENTIONS ALONE CANNOT PRODUCE GOOD MACHINERY. Most all manufacturers are honest, but lack the experience and equipment necessary to turn out a thoroughly first class engine. We are the founders of the Gas Engine industry in the United States; have been building **OTTO** engines for 27 years, and operate the largest and most complete plant in the country devoted exclusively to the building of Gas and Gasoline Engines. Which will you buy, **Otto Experience** or **Others' Experiments**

Dosing Cattle.

ED. HOARD'S DAIRYMAN:—I used to know good men who, in the spring would always make themselves tea from the bark scraped or cut from the sassafrass root—I guess as a punishment. They used to say they did it to thin their blood, purify the system, tone themselves up, etc. These self-punishers belonged to that revered and estimable class of citizens who fed their growing boys sulphur and molasses if a pimple or sore appeared on the boy's face.

Now, in both these cases sassafrass tea and sulphur and molasses may have been exactly what the patients needed, but as one of the patients I always doubted it.

The application of this discourse on home-made medication to the dairy business may be found in that large and well meaning class of dairymen and other stockmen who think the health and profitable working of their animals requires that frequent doses of powders and condimental foods shall be administered.

These same people who used to tea themselves with sassafrass treated their cows for hollow-horn by boring gimlet-holes through the horns and tying an old stocking-leg filled with salt around the base of the horns. For "wolf in the tail" the skin of the tail was generously slit, turned back, the opening filled with salt, and the whole bound up. For bloody milk, the more Dutch of our friends would find a toad somewhere about the cow's trough and kill the toad. It is true the cows had to embrace the doctrine of "absent treatment" to be cured thus, and it was pretty hard on the toad, "which doth hide a precious jewel in its head."

The present leaning toward spring medicines for human use, and condimental powders and foods for the animals, marks an intellectual advance from some of the old notions, and some day we shall find an intelligent conception of the balanced ration—that is, a ration containing a variety of wholesome, easily digested foods, supplying all the needs of the animal—will more cheaply take the place of the patented foods. That these latter are profitable additions to many rations I do not deny.

When a cow is fed nubbins, weather beaten corn stover, wheat or buckwheat straw at the stack, and religiously kept out in the winds and rains and snows in order to make her healthy, the wolf is not in her tail, it is at the other end—the wolf is at the door.

INSUFFICIENT FEEDING.

To my mind this is the greatest single dairy sin to-day. Many a good cow has degenerated into a hanger on, a place taker, because she has not been fed enough of the right kinds of foods. Now the novice in dairying must not think he can undo in a month's good, sensible feeding, the harm that has become almost established as part of the cow's nature from long periods of poor feeding. I would never reject a cow that my judgment told me ought to be a good one until I had fed her uninterruptedly well, at least a year.

We may laugh at the pioneer dairymen who fed nubbins and straw, and exposed their cows to the winter weather, but there are as many large herds exposed to the hardships of poor pastures and flies during our summers, as there were small herds underfed and poorly housed in the winters of our fathers.

There was no so-called dairy science then with a light for them to live up to. There is the science today. We have the experiments, the books, the papers and much light from some sources, overmuch-light, but are we living up to it—not all of it, but the clear, white best of it?

BACTERIA.

I have observed that since the Year Book of the National Agricultural Department has been out, the newspapers have considerable congratulation for us farmers, because the Government is breeding bacteria for us to sprinkle on our lands, for growing the leguminous crops.

They are to be solidified and compressed into the semblance of yeast cakes, which the farmer soaks and sprinkles the soakings over his land. Great results are promised, especially on poor and unproductive land, where crops of peas, beans and clover are to be improved at percentages of increase that make some of the calculations on the mining schemes, so plentifully infesting the mails for some time past, look like thirty cents.

It would appear to a lay farmer that for these friendly germs to live and carry on their beneficent operations for our legumes, soil conditions favorable to their living and work would seem necessary. Can they live and work without moisture, warmth, air—in a word, humus? If they can, then indeed do they bring good news. If they cannot, then we scarcely need them, for good land well tilled rarely fails at the harvest.

Pa. W. F. MCSPARRAN.

Siloing Whole Corn.

ED. HOARD'S DAIRYMAN:—G. L. S., of Dane, can silo his corn whole with success by putting it in in layers and lapping one layer on the other one-half its length. I built a silo last September, 10×12 feet with a depth of 22 feet, 6 feet of which was in the ground below the stable floor. The earth constituted the floor and the sides were built of pine boards ¾ and ½ inch thick and from 4 to 7 inches wide, taken from my own land and sawed at a cost, beside handling, of $3.50 per thousand feet. Frame was made of 2×8 pine set 15 inches from center to center and well bridged to keep from springing. Boards were doubled, joints broken and red rosined paper used as a lining between them.

The upper barn floor is about seven feet below top of silo (it occupies one corner of bay) and by driving up with a load of corn and placing a plank on wagon rack with one end resting about three feet below top of silo, two men could unload the loose stalks in armfuls as fast as two more could take care of them in the silo.

By keeping the sides a little higher than the middle, which was done by placing a line of small bunches lengthwise around the inside of the silo and tramping them well, and jamming doubled up bunches solidly into the corners, we lost but very little; not more than a common wagon box full altogether from rotten corners and top of silage.

There was none rotten in the corners after getting down 3 or 4 feet, although the way the stuff settled after being put in, made me think that it was all going

THE BROWN BESSIE HERD Offers one bull 14 months old, sired by Recorder, 29239, the only living son of Brown Bessie and has 14 tested daughters. Dam, Relay, 70353, test 17 pounds 2 ounces. She a daughter of Diploma with 61 tested daughters. Also Berkshire Pigs of English and American selected stock. H. C. TAYLOR, Orfordville, Wis.

KING OF ST. LAMBERT'S KING 30752
Sire of thirty-three tested daughters, is unquestionably the most prepotent of any Jersey sire in the land. We have for sale young bulls rich in his blood; also a few cows and heifers in calf, whose progeny will be attractive because of the "Hart's King" blood in them. For prices, etc., address FRANK W. HART, CLEVELAND, OHIO.

FENCE! STRONGEST MADE. Bull Strong, Chicken-Tight. Sold to the Farmer at Wholesale Prices. Fully Warranted. Catalog Free. COILED SPRING FENCE CO. Box 103, Winchester, Indiana, U. S. A.

Cream SEPARATORS. All about them and other things for the dairy and creamery. A. H. REID, Philadelphia.

NORTH OAKS FARM, ST. PAUL, MINN. (Jas. J. Hill, Proprietor.)
AYRSHIRE BULLS
Of all ages for sale at very low prices. These bulls are from the best Ayrshire herds in the United States and Canada. Address, N. E. McKISSICK, Supt., Cardigan, Minn

AYRSHIRE CATTLE of the BEST of BREEDING. Also Chester White Pigs, ready to book for season's trade. Young stock of both sexes. Prices reasonable. Come and see us. F. TSCHUDY & SONS, Monroe, Wis.

Florham Guernseys.
The herd is made up of representative animals of both home and foreign breeding.
BULL CALVES,
from large producing dams for sale. Apply to J. L. HOPE, Supt., Florham Farms, Madison, N. J.

Old Homestead Guernseys.
Greatest Prize Winning Herd of the Breed, defeating all competitors at 22 state fairs during last five years. 20 cows of this herd indicated by Babcock test, an average of 456 pounds butter per cow for one year. Several bulls of service age, and a large number of bull calves for sale; also a few choice females.
Especially low prices, standing of herd considered. No catalogue. State what you want.
L. V. AXTELL Perry, Lake Co., Ohio.

GUERNSEYS FOR SALE
Bull two years old out of Count Topsy 24.27 lbs. butter 7 days. She won 1st prize at Wis. State Fair 1902. Also a few yearling bulls and bull calves. FRED CLAUSING, Grafton, Wis.

GUERNSEYS FOR SALE. The increase of my herd is a few young things of both sexes, from one to eighteen months old. Prices corresponding to age and quality F. W. TRATT, Whitewater, Wis.

Wasteland Guernseys
Herd headed by Sir Coral, 5239 (son of Coralette, 560 lbs., grandson of Fantine 2d, 607.7 lbs.) and Glenwood's Sheet Anchor of Haddon, 6372, (son of Glenwood Girl 7th, 506.5 lbs., and grandson of Rutilla's Daughter, 571.4 lbs.) Some elegant young bulls and bull calves for sale.
M. M. & E. J. HOLLINGSWORTH, Landenberg, Chester Co., Pa.

GUERNSEYS FOR SALE.
Largest herd in the West. Descendants of the cows Lily Ella and Lilyeta. Service bulls are Vanquisher, grandson of Lily Ella, Imp. Troupers Pride, Tops of Gold and Lord Yeza.
JAS. H. BEIRNE, Oakfield, Wis.

GUERNSEYS.
HADDON FARMS—Home of the noted GLENWOOD GIRLS—First in the Advanced Registry. Have always been free from tuberculosis. E. T. GILL, Haddonfield, N. J.

Rosendale Guernsey Herd
TUBERCULIN TESTED.
Sixty head of choice Guernseys headed by Coralette's Son, (see page 450) whose dam, Coralette made 479.7 lbs. fat in one year at 3½ years old, and was first prize cow at Wisconsin State Fair in 1896.
Some fine young bulls for sale.
GEO. C. HILL & SON, Rosendale, Wis.

READY FOR SERVICE
YOUNG JERSEY BULLS
Now ready for service or fit next Winter and Spring. Tested dams with high yearly butter records. St. Lambert, Combination, and Brown Bessie blood. Prices from $30 to $150, according to age and breeding.
E. E. STEVENS, North Madison, Ohio

W. J. HUSSEY, Mt. Pleasant, O

VALLEY FARM Offers for sale a son of "King of St. Lambert's King" out of a daughter of "Gazilla's Fawn," dropped July 29th., 1900. Also have some young bulls. Write your wants to FRED STUBLEY, Black Earth, Wis.

PROSPECT HILL JERSEY HERD.
Mature cows yearly records are from 405 lbs. to 740 lbs. butter. YOUNG STOCK FOR SALE. Come and see them. Tuberculin Tested. F. H. SCRIBNER, Rosendale, Wis.

into the manure pile before the cows had a chance at it.

It was my first trial with silage and my first silo, but it shall not be my last, for without that silo we would have lost all of our corn fodder on account of its immature condition, because of the cool season. It was mostly sweet corn, a little being sorghum.

The sweet corn was away ahead of the sorghum for making milk. We put in the stuff in alternate loads of sweet corn and sorghum, as long as the sorghum lasted. In feeding, when we would reach the sorghum, down would go the milk yield, but just as soon as we began on the sweet corn again, up it would come. Talk about ensilage not being good feed! why these cows would quit their bran to eat that ensilage.

After trying the horses on it once, they would call for it every day and they got it too, just as long as it lasted, which was up to March 10. When it was gone we missed it and a whole lot of milk too, about the same time.

The cost of that silo was less than $15 in cash and is the most profitable piece of furniture we have on the farm. We cut corn with a home made sled cutter, drop two armfulls in a place and when the field was cut, began hauling to the silo, using the most of three days in filling.

In closing let me say that after the silage had settled for a couple of days, we watered the top *a la* HOARD'S DAIRYMAN. Near the bottom we had to use a potato hook to loosen it up, so we could get it out.

K. W. L.

Minong, Wis.

Why Milk Varies in Test.

Prof. J. A. Conover of the Kansas Station, writes of milk tests as follows:

"At nearly every institute attended by Prof. Cottrell and myself, the question was asked: "What is the reason our milk tests 2.6 per cent one month and next, under exactly the same conditions, it tests 4 per cent or more?" There are a great many things that affect the test, so that we cannot point to any one thing as doing it. In the first place, the conditions are never "exactly" the same; the pasture may be better one month than another, the weather may be cooler or warmer, perhaps you encourage the cow less with the milk stool, or perhaps the boy who brings them in does not get them so much excited. All these things, and many more, influence the per cent of butter fat."

Kindness is sure to be rewarded by an increase in both the per cent of butter fat and also in the milk yield; whenever you abuse the cow, either by a sharp word, the milk stool, or by running her, you are taking money out of your pocket by decreasing the per cent of butter fat, and also the yield of milk. Whenever the cow suffers for lack of food, water or lack of proper care, there is a decrease in the amount received from her.

There are other reasons why your test may be lower one month than another. When the milk is warm, it churns very easily, so that when you send your milk to the station in cans only half full, they will be partially churned when they get there. There is no way of getting a fair sample of such milk, for the butter fat that is churned is lost both to the patron and to the creamery. If you have a can and a half to send, fill one can full, so that you will be sure to have that much that will not be churned. Keep the milk as cool as possible, as it does not churn so readily at a low temperature.

If you do not want low tests, do not take the first milk yourself and let the calf have the last. The first milk often tests as low as one-half of one per cent, while the last will test from ten to twelve per cent. Don't skim all your milk before you send it to the station, and then expect it to test six per cent.

To the creamery man I would say, keep all the samples of milk from churning, if possible: good tests can never be obtained from a churned sample without the use of ether, and this is too laborious a process for you. It is claimed by some that simply heating the milk to a temperature that will melt butter fat will answer, but my work in this line convinces me that satisfactory results can never be obtained in this manner.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA.

President, HENRY STEVENS; Secretary, F. L. HOUGHTON, Putney, Vt.; Superintendent of Advanced Registry, S. HOXIE, Yorkville, N. Y.

FEES FOR REGISTRY.

TO MEMBERS—Males, $3; females, $1. Double fees for animals over one year of age. Transfers, if recorded within 6 months of date of sale 25c each.

NON-MEMBERS—Males, $5; females, $2. Over one year of age, double fees. Transfers, if recorded within 6 months of date of sale, 50c.; over 6 months, $1. ☞All blanks furnished free.

Life Membership, $25.

Advanced Register in charge of Supt. HOXIE, as above, who will furnish all information and blanks therefor.

PURE BRED SHORTHORNS
CHOICE BULLS FOR SALE.
Also Cows and Heifers bred to Clay Buttercup, 126851, a descendant of the Clay Family, champions at the World's Fair dairy test.
GEO. WENHAM, Fort Atkinson, Wis.

Bread an' Milk.

Brown bread an' milk an' sweet apple,
with a spoonful o' cream, ye know,
Is there anything else ye think of that sets
you a-longin' so?
Ye can see the bins in the suller, where
the pound-sweets used to be,
An' smell the supper a-cookin'|an' the
steepin' o' mother's tea.

An' the cows at the barn to greet ye,
ole Speckle an' Bess an' Brin;
An' then when the chores were finished
an' the wood an' the shavin's in,
With cheeks as red as yer mittens, an'
eyes that were all aglow,
A passin' your bowl to father for the
spoonful o' cream, ye know.

Perhaps what they call their menus
may be a slight more great;
Perhaps there are fancier dishes set by
the rich man's plate;
But I wouldn't give up the mem'ry for all
o' their fuss and show
O' the bread an' milk an' sweet apple
that I et in the long ago.

—*Ladies' World.*

Fat Veal Wanted in Skim Milk Calves.

A Massachusetts Appeal.

ED. HOARD'S DAIRYMAN:—Can anyone tell me how to make separator veal calves fat inside? I have been experimenting all summer and it is slow work. The calves grow fast and look in good order, but the butcher finds no fat inside. I have fed large quantities of milk and in addition, oil meal, corn meal and ground oats. I tried cooking oil meal and adding to the milk, but found it much more likely to cause scours than the separator milk alone. Has anyone tried cotton seed meal?

Abington, Mass. S. B. R.

We submit the above question to our readers but without much expectation that the sought for informatien can be had. For reasons which it is difficult, if not impossible to explain, there is something in milk fat for calf development that cannot be otherwise supplied, as stated by our correspondent. The calves will grow and look in good order, but there is something about the flesh and the distribution of fat that apparently cannot be had with any combination of meal and grain and skim milk.

However, if any of our readers can shed any light on this question or give this inquirer any hints, we shall be very glad to receive and publish the same.

Defending the Scrub Cows.

ED. HOARD'S DAIRYMAN:—I was in the sheep business until I was forced out on account of wolves. I then sold out and turned my attention to cows. I bought a number of scrub calves and bred them at about 18 months old; they are doing fairly well, but of course I have to weed them out. There are a few that are not up to my standard and some that run over. My standard is not high. I will keep a cow that produces one pound of butter fat a day; anything lower than that I will not feed.

I had a notion to change my herd gradually to Jerseys. But in reading the DAIRYMAN I have changed my mind, as the DAIRYMAN bears me out in what I always contended, that if our common native cows were used and fed as well as the little, registered Jerseys commonly are, they make a better dairy cow.

I have always contended that such cows as Brown Bessie and other phenomenal milkers were only sports, and by pampering and forcing they were brought up to their high record. I presume that every pound of butter made from Brown Bessie, cost the owner a dollar.

Your correspondent, H. H. L., page 606, bears me out in my theory. He says of visiting a herd in York state, "my friend has probably no more than an average herd, but when I saw him, his twenty cows were averaging slightly over 400 pounds of milk a day." He calculated a test of an average of 4.56. Now my scrubs are doing better than this, and after being properly weeded out and better cows substituted, I shall expect them to do very much better. J. L.

Wood County, Wis.

Our Wood County friend has entirely misapprehended the teachings of the DAIRYMAN, if he is of the opinion that we think the common native cow is, as a rule, equal to the grade or thoroughbred dairy cow, be she Jersey, Guernsey, Holstein or Ayrshire. We have contended, however, that one can have a profitable dairy without going to the expense of investing in a thoroughbred herd, especially, if he will commence with the calves, and give them a good dairy bringing up, and after they commence to give milk, have the courage to dispose of all that do not prove to be profitable milkers. Then, let him breed these selected heifers to a thoroughbred sire, whose ancestors have shown dairy ability, and he is on the way to the possession of as good a herd of practical working dairy cows as the country affords.

It is altogether a mistake to contend that Brown Bessie and hundreds of other phenomenal milkers were simply sports. They were as far removed from sports as it is possible for a cow to be. They were bred along lines which clearly indicated that when they came to maturity and had a fair bringing up and chance to show what they were worth, they would prove not only phenomenal yielders but economical producers as well.

In the 90 days contest at the Columbian Exposition, Brown Bessie produced 178.12 lbs. of butter fat, the equivalent of 204.47 lbs. of standard butter, and at a cost for feed of $25.51. Feed stuffs were valued as follows: Hay, $11.50 per ton; silage, $4.00; corn meal, $22.00; corn hearts, $13.50; grano-gluten, $14.75; oats, $23.00; cotton seed meal, $26.00; bran, $12.50; middlings, $13.00; oil meal, $22.

Galalith (Milk Stone.)

Consul General O. G. D. Hughes, of Coburg, Germany, reports as follows:

At the Hygienic Milk Supply (Hygienische Milchversorgung) Exhibition, which was lately held at Hamburg, the Vereinigten Gummiwaren-Fabriken, of Harburg and Vienna, exhibited a number of objects which seemingly had nothing whatsoever to do with hygienic-milk supply. There were shown, nicely arranged in glass boxes, combs seemingly made of horn; cigar holders, with amber-colored mouthpieces; knives and forks,

THE

"1900" FAMILY WASHER FREE

Greatest Invention of the Age. Labor and Expense of Washing Clothes Cut in Two.

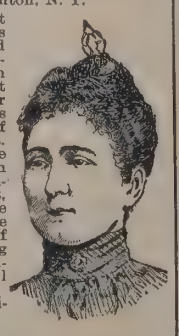
No More Stooping, Rubbing or Boiling of Clothes.

Every Household Needs One.

THE "1900" BALL-BEARING FAMILY WASHER SENT FREE

to anyone answering this advertisement, without deposit or advance payment of any kind, freight paid, on 30 days trial. The "1900" Ball-Bearing Washer is unquestionably the greatest labor-saving machine ever invented for family use. **Entirely new principle.** It is simplicity itself. There are no wheels, paddles, rockers, cranks or complicated machinery. It revolves on **bicycle ball-bearings,** making it by far the easiest running washer on the market. No strength required; a child can operate it.

No more stooping, rubbing, boiling of clothes. Hot water and soap all that is needed. It will wash **large quantities of clothes,** no matter how soiled, **perfectly clean in 6 minutes.** Impossible to injure the most delicate fabrics.



An Enthusiastic Admirer.

Chicago, Ill., March 22, 1903.

The "1900" Washer Co., Binghamton, N. Y.

The washer that I bought from you nearly 2 years ago is in the best condition yet, and I believe it always will be; nothing has been worn out or broken off; every part is as good as it was when I bought it. Neither have I noticed that my clothes through the continuous use of the washer have been worn out. Your washer don't rub the clothes to pieces or wear them out. It is really the best washing machine on the market, and if I could help it there would not be a house-wife in the United States without one of your "1900" ball-bearing washing machines. I heartily recommend it to every lady, for it will save her a lot of hard work.

Mrs. A. H. CENTNER, 636 Diversey Boulevard.

St. Jacobs Oil

The surest, quickest cure for Lumbago.

with handles similar in appearance to ebony; ferrules for umbrellas and sticks, and balls, rings, chess figures, dominoes, etc.; also a small table with an inlaid marble slab, and finally a number of thick slabs and staves with every imaginable variation of marble colors, but of considerably less weight than real marble. These objects were made of "galalith"—i. e., milk stone.

Skimmed milk, in spite of its many valuable qualities, has so far been little used; it contains a considerable portion of nutritious matter—i. e., 1 liter (1.05 quarts) of skimmed milk is of about equal value to a quarter of a pound of meat. It is by far too little appreciated as a cheap food for the people, hence what the German peasant cannot sell to milk-sugar factories, or use for the manufacture of cheese is given to cattle and pigs as food. The principal albuminoid substance of skimmed milk, the casein, is the raw material out of which the new product, galalith, is manufactured. More than fifteen years ago the idea was originated to manufacture various articles like buttons, handles, ornamental plates, and colored pencils out of casein.

The inventor took out a patent for a manufacturing process, which is described as follows: Fresh casein—*i. e.*, ordinary dried curds—were disolved in hot soap water; to this solution the required coloring ingredients and a metalic salt were added, and a firm substance consisting of casein and metallic soap was produced, which, by drying and pressing into moulds, could be given any desired shape. It is to be supposed the inventor had found out by continued trials that casein by addition of a metallic salt becomes brittle and softens easily in water. With a view of counteracting this latter drawback, soap was added, but the articles produced thus were soft and brittle, and the invention was not a success. The chemical factory of Schering at Berlin then invented a process, the idea of which was to make casein insoluble by the addition of formaldehyde, but the disadvantage of this invention was that the articles produced distended considerably in water.

The inventors of galalith succeeded, after many troublesome trials, in doing away with the deficiences of former methods and in using the good that was in the former ones for the working out of an entirely new process. Their first aim was to make an insoluble union of casein by the addition of salts and acids. The substance thus obtained was dephlegmated and dried, and, finally, by the addition of formaldehyde, the galalith was obtained. To produce, for instance, a material similar to ebony, which could be used for handles of table knives, they proceeded as follows: Dissolved casein was given a dark color by the addition of soot and, with the help of a metalic salt, "acetate of lead," a slate-colored precipitate was obtained. This was mixed with water and the thin pap filled into a cloth stretched over a frame. The water becoming absorbed by the cloth, the pap contracted into a unfiorm, firm, and dark mass; this was placed in a solution of formaldehyde and, after being dried, a product resulted which in luster and color was equal to ebony. In this way a raw material is produced which the inventors have protected by numerous patents.

An advantage of the new product as compared with celluloid is the fact that it does not ignite so easily and is entirely odorless. Trials have proved that even when kept for weeks in water it does not distend more than the best quality of buffalo horn; after one month it had not soaked in more than twenty per cent of water. Of late, trials have been made to produce, by the addition of vegetable oils, an insulating material for electrotechnical purposes.

The Reading Dairyman Wins.

I have seen one dairyman with a beautiful home, large and well ventilated stables, all the product of a herd of milk cows, and another farmer with the same old house he built ten years before, dilapidated stables, gates broken, fences down, all the product of another herd of cows, equal in number to the first. Why this difference with the same conditions?

If you go into the home of the first class of men you will find agricultural papers; you will find a reader, a man who has a thinker and is using it. He may not be a graduate of any agricultural college, but he is a self-educated man, who received a large part of his education from the agricultural papers. How much more advanced he would have been if he had learned the rudiments at the Agricultural College! But greater honor is due to self education than to the college educated man. Still, if progress was to depend on self education, we would resemble the snail instead of the ant.

I am a firm believer that the duty of every state is to place a premium on agricultural pursuits. The most important branch of agriculture is dairying. The growth of cereals depends on dairying to return its elements to the soil of which the soil has been robbed by their growth. Dairying enriches the soil, while the growth of cereals impoverishes it. Therefore no branch of agriculture should be fostered and encouraged as much as the dairying industry.—E. A. McDONALD, Washington State Dairy and Food Commissioner.

The Elwell Kitchen Cabinet

SOLD ON APPROVAL

We shall not attempt to describe it here but invite you to send for our new booklet.

"THE LABORATORY OF THE HOME."

It puts the work of the kitchen upon a business basis—everything handy, sanitary, dust-proof and mouse-proof; easy to keep fresh and clean. Booklet tells why.

Thousands of our cabinets sold—eight styles. Every home-maker wants one. Write to-day for booklet. A postal card will do.

Elwell Kitchen Cabinet Co. 926 5th Ave. S. E. Minneapolis.

Buttermilk Wheying Off.

ED. HOARD'S DAIRYMAN:—As I am having trouble with my buttermilk, for retail trade, separating or "wheying off" shortly after leaving the churn, I ask your advice in handling same to overcome above results. I have handled at high and low temperatures (48° F. to 58° F.) and have the same results. I bottle all of this, and of course it looks badly when delivered. J. M.

Baltimore, Md.

It is difficult to say without more exact information just what is the trouble with the buttermilk, but we are inclined to think that it is too acid. Buttermilk that is decidedly acid wheys off easily, which it will not do if more nearly neutral. We would suggest a lower degree of acidity for the cream unless it would affect the accustomed flavor of the butter, and then cool the buttermilk as soon as possible to prevent further growth of the lactic acid bacteria.

Ensilage From Frosted Corn.

ED. HOARD'S DAIRYMAN:—I note some of your readers wish to know about making ensilage from frosted corn.

My experience last year was that good silage can be made from badly frosted corn, and that the cattle find it a very palatable ration and that it made an excellent quality of milk, without the use of an excessive amount of other feed. The ensilage kept perfectly, though we used but a small quantity of water, perhaps one-half dozen barrels on the two last days cutting.

Dimensions of silo, 30 x 30. We cut 55 acres of badly frosted corn, in fact the leaves were so dry the last two days that they flew around like chaff, and it was on account of the dry condition of the corn, in the afternoon, that we used the water.

One peculiar feature was that the frosted corn did not heat to above 80°, and in using from the silo there did not seem to be evidence of having attained a higher degree of heat.

I do not think that you make a mistake in recommending the filling of silos from frosted corn, and I would say after the frost comes, put your corn in the silo as soon as possible.

CHAS. HOWELL.

Cerro Gordo Co., Ia.

Handling Frosted Silage Corn.

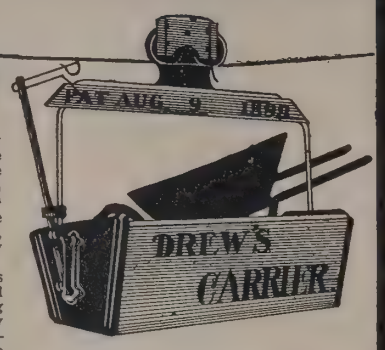
The present outlook is that a large amount of ensilage corn will be frosted before it is sufficiently matured for good silage. If this happens the chances are that there will be a large amount of poor silage made for want of proper handling. When corn is frosted the result is a breaking of the plant cells, allowing the sap to escape, with a rapid drying of the plant. If such dry corn is put in the silo it will not pack well nor go through the usual siloing process and the result is a mass of moldy ensilage. Experience has shown that if such corn is wet thoroughly when siloed, perfectly good ensilage can be made; but it needs water, lots of it. Forty barrels to the average silo is not too much, but it must be distributed as evenly as possible during cutting. The following letter, published in HOARD'S DAIRYMAN, September 19, 1902, gives one man's experience with frosted corn and we advise a careful reading of the same:

ED. HOARD'S DAIRYMAN:—Reading several discussions lately of the different methods of handling corn for siloing, I thought I would add my plan by which I saved my corn last year, after a frost which had completely killed and dried it.

We had one hard frost which completely killed everything in the crop line, and I found my corn next day so dry you could hear it rattle across the field.

The next morning the agent was setting up a McCormick, and I was hustling things to be ready.

The next morning at 3:30, I was in the field with outfit and one man, and I cut and he piled bundles on ground, laying flat and in piles, containing 2 to 3 good sized shocks in a pile, and we worked as long as corn was wet with dew, then went to breakfast.



We could cut all day on what was down, and the bound bundles would open damp and handle fine, and my silage was fine all through; no dry rot nor fired silage in it.

I think my moisture was distribut

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED "THE MASTER WORKMAN"

A two-cylinder gasoline engine; superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started. Has a wider sphere of usefulness. Has no vibration; can be mounted on any light wagon as a portable. Weighs less than half of one cylinder engines. Give size of engine required. Sizes 1½, 2, 2½, 4, 5, 6, 8, 10 and 15 horse power. Mention this paper. Send for catalogue. THE TEMPLE PUMP CO., Meagher and 15th Sts., CHICAGO.

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The

DREW ELEVATED CARRIER

will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating—it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.

It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

"WATCH IT WORK FOR YOU"

WRITE FOR OUR ILLUSTRATED CATALOGUE, FULLY EXPLAINING ALL ABOUT IT.

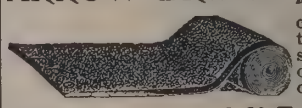
Also makers of the famous Neponset Red Rope Roofing and Siding.

SAVES ITS COST ON THE FIRST CROP.

It spreads all kinds of manure, lime, salt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.



Do you know of any other piece of machinery for use on the farm of which this can be truly said?

The Improved Kemp Manure Spreader

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new **Beater-Freeing Device, Apron-Returning Device** and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about **"How to Grow Big Crops."** Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court. KEMP & BURPEE MFG. CO., BOX 46, SYRACUSE, N. Y.

ARROW BRAND Asphalt Ready Roofing

more evenly than any number of barrels set over cutter could possibly have done it, and at lots less expense and trouble, if you consider that you don't have to wait on cutters, but cut with a machine that does fine work and never grumbles (if you oil it). We repeated same routine each day until silo was filled.

Logansport, Ind. SAM SMITH.

Ropy Milk.

ED. HOARD'S DAIRYMAN:—For the past month I have been troubled with stringy or ropy milk. We use the milk for town delivery. It is very objectionable. The milk contains no clots, for when it is strained it does not stop up the strainer, but flows through as freely at last as in the beginning. I have never been able to find anything upon the strainer.

The milk is cooled over an aerator and immediately set into ice-water. The vessels used are all properly cleansed, and the water in the vats is clear and pure. The cows graze upon a blue grass pasture, and are healthful and in the best of condition. Salt is continually before them. H. A. B.

Magengo, Iowa.

Ropy milk is the result of the work of a specific bacteria growing in the milk. When once contaminated with this species, it seems to be necessary to go through the stables, as well as the dairy utensils, and make a thorough cleaning out of everything connected with the production and handling of the milk. This calls for a thorough scalding and cleansing of dairy utensils with boiling water and washing soda. The wash water must be scalding, as this species of bacteria and its spores are very resistant to heat. See that the stables are cleaned out, it may be necessary to whitewash; brush the cows well, especially the udders, and if there are any mud holes in the pasture or elsewhere, that they have access to, fence them off. If any milk is bought from other dairies, set a small quantity of such milk to see if the ropy milk does not come from the outside dairies. Ropy milk is difficult to get rid of, hence the cleaning must be thorough.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Indigestion.

I have a cow well and hearty apparently, but her droppings are too thin, so much so, that she is poor in flesh, for everything passes right through her. She fills up good and full during the day, but voids large quantities through the night, and in the morning she is quite hollow, and it makes her bones show. The droppings will spatter four feet each way; she is on grass and has no grain.

Saco, Maine. MRS. S. L. B.

ANSWER.

Give a complete change of diet, such as is easily digested, including some first quality hay, and give in each feed a tablespoonful of bicarbonate of soda.

Rheumatism Perhaps.

I have a heifer one year old who is lame on her left front foot. I examined her foot but can't find anything. She walks as though her leg was asleep There is no swelling She has been lame for two weeks. A. H. P.

Spring Hill, Minn.

ANSWER.

Have the leg examined by a qualified veterinarian, and make sure of the cause, then he may be able to find a remedy.

Milk Fever.

We would like to have some light on milk fever and the Schmidt treatment. During this year we have had four cases of this disease, all of which we treated with the Schmidt treatment, but only one of them successfully. In every case the treatment seemed to give relief at first. As the cow did not seem to be fully relieved, a second dose was administered in every case. In the only case in which the cow finally recovered, she was apparently well within 24 hours after being treated, though, of course, she was very weak. In the other cases the animal would get up and walk around, but would eat nothing. They all appeared stupid, and this stupor increased until death ensued.

The last one to die, calved August 13th. On Aug. 14th she was taken with the fever, showing the first symptoms about 36 hours after calving. The Schmidt treatment was administered at once. In about 4 hours she got up and appeared to be doing nicely. But about 18 hours after the first dose was given she appeared to be getting worse, so another dose of the iodide of potash was used, apparently with beneficial results. After that she seemed to contract a cold, showing a heavy discharge from the nose, and continued to grow worse. Yesterday, Aug. 19, she had a high fever, her temperature going to 109. She was bathed in cold water, which seemed to give some relief. Last night she died.

In connection with the Schmidt treatment I used heavy doses of Epsom salts and gave 3 oz. doses of aromatic spirits of ammonia and spirits of nitrous ether, as recommended by Dr. McIntosh Do you think I gave too many or too few doses of potassium iodide? Does this treatment have any weakening effect on the cow? Could the use of ammonia and ether, in connection with the Schmidt treatment, have done any harm?

CLOVERLANDS DAIRY FARM.

New Orleans, La.

ANSWER.

In the opinion of the writer, you have made your mistake in giving the heavy doses of Epsom salts, as such will almost invariably kill when a cow is in the state of stupor. The large doses will find their way down into the trachea and into the lungs, which results in pneumonia or immediate suffocation. The stimulants should be given in smaller doses, and repeated every hour, so small that they will absorb in the mouth. Your potassium iodide treatment was all right, as far as can be learned from your letter.

Lump Jaw.

Heifer has a bunch forming under her throat. This bunch I noticed about three weeks ago. It seems to be growing; is now about 4 inches long, about 1¼ inches in width; it seems to be soft and flabby. N. N.

Black Creeek. Wis.

ANSWER.

If your heifer has not bruised the enlarged parts, so as to cause the swelling, we are inclined to believe that it is the acute stage of lump jaw. Should it continue to enlarge, see lump jaw, this issue, and apply same treatment.

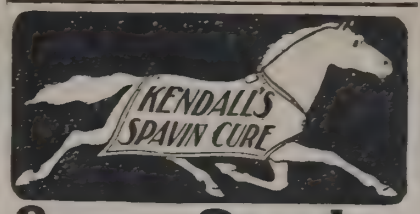
Unknown Disease.

There is a disease among the cows here that is new to me; it kills very quickly. It is very much like distemper with horses. The cow's nostril become clogged with matter, like a horse with distemper, until she can't breathe, except with her mouth open; she has high fever; her throat a little swollen; her head turned to one side as though her side hurt. G. H.

Chepultepec, Alabama.

ANSWER.

Your description is not sufficient to warrant a diagnosis, or suggest a remedy. If the disease is becoming general, you should notify your state officials; or if you wish to have an opinion from this department, please give a minute description of every detail noticeable, and a complete history of the case. You cannot give us too much information in such cases.



Lump Jaw.

My cow has a large round lump between jaw bones as large as man's fist, also swelling upon one jaw bone; has been coming about two months.

Troy, Ala. W. P. R.

ANSWER.

Have the lump dissected out completely and there will be no chance for it to return. Employ a qualified veterinarian, and have it done right to avoid further infection.

Cures Spavins

like magic. Read the testimony below and then resolve to suffer no longer from Spavin, Ringbone, Splints, Curbs and all other forms of Lameness. **Kendall's Cures** them all.

Alfalfa in New Jersey.

ED. HOARD'S DAIRYMAN:—I have a small dairy and am profoundly interested in securing a growth of alfalfa. The spring of 1902 we sowed part of our garden to alfalfa. It produced a fine crop and did well last year. About May 1st, 1903, we sowed 30 lbs. seed on one acre. It came up well but the weeds largely took possession. We have mowed it three times but the alfalfa seems to have largely disappeared. Must I from present conditions, look upon it as a failure, or is it to be attributed to the absence of the necessary bacteria. It is on good soil, where we had 75 bushels shelled corn. We prepared the ground well, applied a good coat of lime, three bags of a complete fertilizer and 200 lbs. sulphate of potash per acre. Am willing to apply any quantity to secure a crop. Would you think it necessary to secure some soil to sow over this acre, provided next spring it has failed, and where can I get it? Our College Farm is a successful grower of alfalfa. Would one barrel of this soil per acre furnish the necessary bacteria? I notice the Editor is a successful grower of alfalfa, hence I write. D. C. L.

Cranbury, N. J.

It does not follow that the field where alfalfa was sown this spring is in as fit condition for that crop as was the garden where trial was made the year previous. The presumption is that peas and other leguminous plants have been grown in the garden for many years until the soil there is fairly well inoculated with the proper bacteria for their best growth. So, if the field where this last spring's seeding of alfalfa was made has heretofore borne good crops of common red clover, we should be inclined to the opinion that there was bacteria enough in the soil to permit the growth of alfalfa, and look for its decay in other directions. On the contrary, if this field has not been tried in red clover, it would be advisable to get some soil from an alfalfa field and scatter broadcast, wherever alfalfa was wanted. Possibly, soil from a garden plat where alfalfa is growing would be as good as any. Certainly, soil from the college alfalfa fields would be all right, and a barrel per acre probably all sufficient.

MELONEY'S Automatic **Milk Cooler** TRADE MARK BESTOV and Aerator

Made of the best conducting material—sheet copper and coated with tin outside where the milk comes in contact. Cools milk quickly. Expels all animal odors and the smell of grass and garlic. Aerates it thoroughly. Can be easily cleaned. Fully guaranteed. Used by the most progressive dairymen. Send for catalogue "Bestov" dairymen's supplies. **Dairymen's Supply Co., Dept. Philadelphia, Pa.**

21 STRONG REASONS

WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to **own** a low-priced farm than to **owe** for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agricultural districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.

WISCONSIN BLUE GRASS LAND CO., Baldwin, Wis.

DAIRY FARM FOR SALE

Improved and Unimproved Farms for Sale

Farm No. 1 consists of 90 acres with frontage on a fine lake where there is excellent fishing and game. This lake is one of a chain of lakes on which you can travel for twenty-three miles. Has two-story house with eight rooms. Two-story log barn. Ice house and ten acres cleared. For sale at a bargain. One mile and a half from the railroad.

Farm No, 2. One-half mile from the railroad. 100 acres or more if desired, five acres cleared. Two-story, eight room house. Glass chicken house. First-class hog pen. Plenty of timber on land for own use, and quite a quantity of saw timber. We have besides this 16000 acres of unimproved land. Heavy black soil. All lies in Central Wisconsin. Low priced Excellent markets. Will grow any kind of crop and produce immense results. Excellent water supply. Splendid markets and a local demand for everything that is raised. None of the land lies more than three miles and a half from the railroad.

WISCONSIN FARMS

Will furnish names of people who have bought from us who have made big success. Can furnish lands in either small or large quantities. Can furnish reduced rates to see the lands. Easy terms to suit the convenience of the purchaser. As safe and desirable an investment as government bonds. Write in for maps and any information you may desire.

INTERIOR LAND CO., Janesville, Wis.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn, (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x2 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

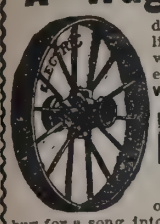
This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

FOR SALE

On account of age and infirmity I will sell my farm of 204 acres four miles of Unionville, Putnam Co., Mo., sixty head of grade Jersey cows and heifers, a two horse power boiler and engine, one No. 5. U. S. Separator, one 100 gallon churn and butterworker with other dairy implements.

For particulars address



J. B. OLINGER, Unionville, Mo.

When Infected Soil is Necessary for Alfalfa.

ED. HOARD'S DAIRYMAN:—What is your opinion in regard to using infected alfalfa soil when first seeding land with alfalfa? I do not remember of you recommending it. Robert O. Denning, of Kansas, in DAIRYMAN of July, 25th, 1903, and others who have been successful in raising alfalfa do not mention infected soil. While others, notably Prof. Hopkins of the Ill. Experiment Station insist on it. The Professor says of their own fields at the University: "The presence or absence of alfalfa bacteria made the crop a success or failure respectively," and they offer to furnish infected soil to citizens of Illinois at a very reasonable price.

Do you sow the seed or drill it? What is the best season to sow? Are you careful to have northern grown seed? How much seed do you sow to the acre.

Meadville, Pa. E. A. R.

The editors of this paper have had very excellent success with alfalfa without using any artificial means for infecting the soil with bacteria, but their farms are in a lime-stone region and red clover has been grown on them more or less for many years. It is fair to presume, therefore, that before alfalfa was thought of in this vicinity, the soil was more or less impregnated with bacteria available for leguminous crops. It is claimed by Prof. Hopkins and some others that alfalfa bacteria differ from the bacteria found on the roots of common red clover, but Prof. Conn and others think that this difference is really caused by the different roots to which bacteria attach themselves. In other words, alfalfa bacteria and red clover bacteria do not constitute distinct species, but are variations of the same species.

There are many things about the successful growing of alfalfa that cannot be successfully taught in words, but must be learned by experience. Our constant advice, therefore, to all parties is, to commence with alfalfa in a very limited, moderate way, and thus ascertain whether the soil and the climate and the conditions are favorable to its growth. If our correspondent has been successful with red clover, we see no reason why he may not succeed with alfalfa without going to the trouble or expense of getting infected soil with which to inoculate his own fields. On the other hand, if common clover is an uncertain and disappointing crop to him, the probabilities are that alfalfa will also be disappointing, and one way to avoid this disappointment would be to get 200 or 300 pounds of infected soil from some old alfalfa field to scatter upon his fields.

It is a current rumor, for which we have seen no official announcment, that the Department of Agriculture at Washington has succeeded in isolating alfalfa bacteria and propagating them, and is now, or soon will be, prepared to furnish these bacteria to parties who may apply.

We have always seeded our fields broadcast, but in some sections, the seed is drilled in. Which is the better way, we are not prepared to say. In the latitude of Pennsylvania and Wisconsin, our judgment is that the only proper time to seed alfalfa is in the spring, and although we have hitherto always used a nurse crop, we are beginning to believe that it is better to dispense with it and sow seed alone. Most of the alfalfa seed used in this part of the country comes from Colorado, Kansas and Nebraska.

We believe heavy seeding desirable, so as to secure a thick stand and prevent the alfalfa from growing too coarse, and for this purpose, we do not consider 25 to 30 pounds of seed to the acre too much.

Turpentine for Lump Jaw.

ED. HOARD'S DAIRYMAN:—I notice an inquiry of what will cure the lump jaw by I. D. V. R. I would like to have him try spirits of turpentine, as I had a valuable Holstein heifer that had a large bunch on her jaw before I noticed it. I saturated the bunch twice with turpentine, and it has taken bunch off slick as can be. I have cured quite a number in the same way. R. L. B.

Manlius, N. Y.

Grit

Grit is a good thing in its place, but a bad thing in butter. Gritty salt—salt that's icy, insoluble, full of lime, chlorides and magnesium, is accountable for many exasperating difficulties of dairymen. It represents a loss of time, labor, money and patience, not always attributed to it. With DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—your butter difficulties will disappear, and a gain in time, *money* and less labor result. Its dry, pure flakes dissolve quickly, imparting a rich flavor and keeping quality that find ready favor and highest market prices. "Just Salt" is a valuable booklet every dairyman should read. We send it free.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

WORCESTER SALT--IT USES NO OTHER

CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

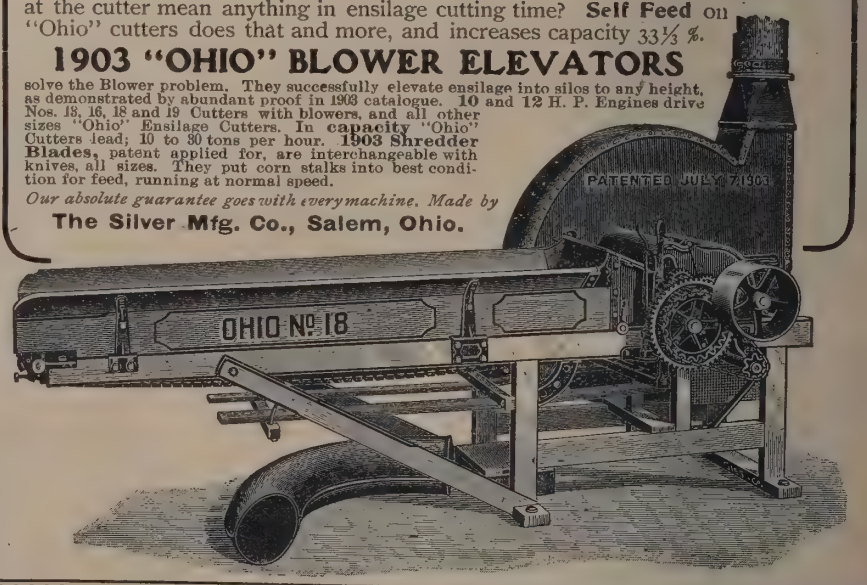
CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

Does Saving ONE or TWO MEN



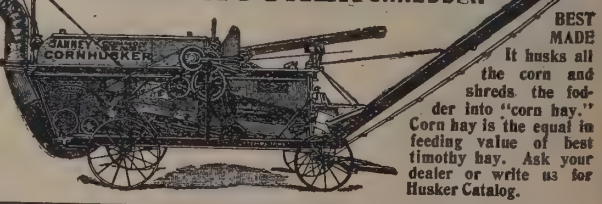
at the cutter mean anything in ensilage cutting time? **Self Feed** on "Ohio" cutters does that and more, and increases capacity 33⅓ %.

1903 "OHIO" BLOWER ELEVATORS

solve the Blower problem. They successfully elevate ensilage into silos to any height, as demonstrated by abundant proof in 1903 catalogue. **10** and **12** H. P. Engines drive Nos. 13, 16, 18 and 19 Cutters with blowers, and all other sizes "Ohio" Ensilage Cutters. In **capacity** "Ohio" Cutters lead; 10 to 30 tons per hour. **1903 Shredder Blades,** patent applied for, are interchangeable with knives, all sizes. They put corn stalks into best condition for feed, running at normal speed.

Our absolute guarantee goes with every machine. Made by

The Silver Mfg. Co., Salem, Ohio.



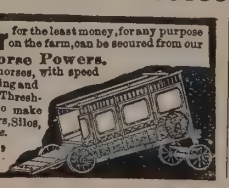
HUSK YOUR CORN, SHRED YOUR FODDER, SELL YOUR HAY

A corn crop may be profitable without saving the fodder, but IT WILL BE TWICE AS PROFITABLE IF IT IS SAVED. The new method of handling corn saves the entire crop. The new way is to run all the corn through the

JANNEY'S PATENTED HUSKING PIN — IT TAKES OFF THE SHUCK

JANNEY COMMON SENSE CORN HUSKER and FODDER SHREDDER

If you feed corn hay you can **sell all your meadow hay.** You can also bale and sell your surplus corn hay; big demand. You may add further to your profits by husking and shredding for your neighbors. Pays better than a threshing machine and costs less. Eight years in the field. More in operation than any other.



BEST MADE

It husks all the corn and shreds the fodder into "corn hay." Corn hay is the equal in feeding value of best timothy hay. Ask your dealer or write us for Husker Catalog.

500,000
Cream Separators in Use, and 500,000 Dairymen adding to their wealth as the result.

The dairy separator is universally recognized as a money making, money saving, and labor saving farm implement.

THE TUBULAR CREAM SEPARATORS are **known the world over and the percentage of increase in their sale annually is greater than that of all other separators combined.** THE REASON IS PLAIN. The **Tubular** is a modern, up-to-date machine—simple, durable, efficient, easily turned, easily cleaned, easily put together, and easily kept in order. It is the only separator with a low down supply can, and has many other conveniences not found in other machines. Compare the **Tubular** with any other make of cream separator and you will be convinced.

There are a dozen or more of the old style bucket bowl separators, some with discs, some with blades, some with cones, some with radish graters, and some with other contraptions inside the bowl; all about alike and not much choice. **There is but one Tubular** and it is guaranteed to be the most convenient, durable, and serviceable separator made. Beef Versus Dairy Breeds.

ED. HOARD'S DAIRYMAN:—The farmer who breeds or feeds either cattle or sheep, for the block must not ignore the distinction between the distinctly beef making types of cattle, and the dairy type, or the best type of mutton producing sheep. He cannot afford to be ignorant on these points. They are of vital importance, and determine profit or loss. "Economy of production" must be understood, and the successful stock owner must breed with this end in view, of making a certain amount of food produce the largest possible amount of gain, and such gain be relegated to the parts desired to be finished according to the market requirements.

The prime beef type calls for short limbs, but a broad, straight back, well sprung ribs, broad chest, etc., and the broad back and ribs must be well covered with flesh, and an even distribution of fat. The heavy, inordinately fat animal has been driven out of market by the demand for one of different type. Another point in favor of the distinctly beef producing breeds as bred for the market, is the fact that the beef of such animals is always superior to that of animals of distinctly dairy type. In our grandfather's days the excessively fat steer or cow, etc., was the one which "topped the market," avoirdupois being the end generally sought then—it was tallow versus beef—those were the days of tallow candles. Other means of illumination and lubrication have been since discovered, and distinctly fat or tallow producing animals have been relegated to the back ground.

A point which also must receive due attention, is reference to the age of animals which are to be fed for market, *i. e.* the block. Experience and experiments have shown that the young and growing animal fattens more easily, than when grown or fully matured. As animals progress toward maturity the returns or gain for food consumed is much less. The young animal furnishes the most profitable carcass, and there is not a superabundance of fat where not wanted; this should receive attention when at all practical to do so. Early maturity of animals for market may be accomplished by generous feeding of such cheap, coarse foods as the farm produces, combined with grain enough to give a suitable ration; the amount of grain may be moderate, except in the finishing up.

As an example of the characteristics of the beef and the dairy types, take the Jersey or Ayrshire, and compare with that of the Hereford or Durham. Those who are at all acquainted with the former will concede that the "little Jersey" was never intended to be anything except what she is, one among the best butter cows bred, or the highest type of dairy animal. She is, as a rule, rough, angular and bony, and when fattened the Jersey does not develop along the lines demanded by the market; but instead accumulates fat around the internal organs, while the prominent parts, back and hips, are scantily clothed with flesh; and the same may be said of the Ayrshire also.

On the other hand, the Hereford or Durham which has been bred for generations "to hoard up everything she eats, and yield it up only with her life" belongs to the best type of beef producing animals. A Hereford cow will give scarcely milk enough to raise her calf, but puts all she eats upon her back instead of in the pail, as a rule.

As to food, the Jersey will consume the same amount probably as the Hereford, all things being equal, and the gain in weight be nearly the same, but the Jersey does not lay on flesh readily, and on such parts of her anatomy as will bring the best results *i. e.* highest prices. Tallow cannot compete against loin and rib roasts. The Durham or Hereford is capable of taking on flesh and fat in the proportion required, and finishing up to the point of highest excellence.

Individual preference finds no recognition in the stock buyers' catalogue. He is buying for a certain end, either dairy or beef animals, and he knows what he wants, and is imperative in his demands; the producer must conform to his requirements or requisites or lose results.

The breeder or feeder must humor the markets which, in turn, humors the public.

A. C. McP.

Factorymen, printers, farmers, country merchants and others, whose changing duties require very frequent washing of hands, will find that Ivory Soap is just what they want. It lathers quickly and will not make the hands sore or rough, even when used very often, or with a stiff brush. It keeps the skin soft because it is pure; as pure as a soap can be made. It floats.

Paying for Milk at Cheese Factories By Test.

Some Washington Queries.

Ed. Hoard's Dairyman:—The 16th of last May our new cheese factory received the first milk. During June and July we have manufactured about 20,000 lbs. of cheese. The milk is supplied by over 50 patrons, and it is hauled at the expense of the association. The whey is sold for 10 cents per 100 lbs. For May and June we paid 25 cents per lb. of butter fat; for July, 24 cents. How do these prices compare with prices paid in the state of Wisconsin?

Our association is a co-operative association. We paid according to the butter fat. Yet some are kicking. One thinks he has been paid 25 cents only for the butter fat, and he expects to receive payment for the casein.

Now, Mr. Editor, let us know whether you consider that we have done well or not at the start, and whether we are right to pay for the milk according to the butter fat? The farmers who read your excellent paper understand well all those questions.

Aug. 24.—This letter came back, having forgotten the word "Fort," yet it seems to me that every postmaster of Wisconsin knows who is Hoard's Dairyman.

L. Chevalley.

La Center, Washington.

The defectively addressed letter never reached Wisconsin, but was turned back by some extra-technical post-office clerk, for the reason that there is no post-office in Wisconsin named "Atkinson."

During the months of May, June and July of the present year, milk has brought about 21.6 cents net for each pound of butter fat it contained, whether sent to cheese factory or creamery. Neither the cheese factory nor the creamery pays for the butter fat specifically, but for the milk, and the fat contained in the milk indicates its relative value for either butter or cheese.

That is to say, 4 per cent milk is really worth one-seventh more for either butter or cheese than 3.5 per cent milk. The milk is tested for fat simply to ascertain how much butter or cheese it will make and, for short, we talk and write about paying for the fat. When the Kicker referred to was paid 24 or 25 cents per pound nominally for the butter fat, h was in fact receiving pay for his milk according to its cheese making value; that is, he was paid for both fat and casein.

It follows from the above that the method of paying for milk on the basis of its content of butter fat is really the only just and equitable way of running a cheese factory.

Digestibility of Cheese.

Ex-Director C. S. Plumb of the Indiana Experiment Station, in a recent contribution to *Farm and Home*, says:

Many Americans who naturally like cheese do not eat it because they complain that it disagrees with them. This is a characteristic complaint. Consequently Americans eat comparatively little cheese. In Europe this food is a common article of consumption. It frequently takes the place of meat in the family. One may buy cheese sandwiches in Great Britain as readily as those made with meat. The Britisher eats cheese in good sized pieces. In the United States but few consume over a cubic inch at a meal, and many not that much, and then usually with pie. A friend of the writer, a Dane, with a dairy education, was at my table one day, and in discussing cheese, he said; "I never could understand why Americans usually prefer to eat cheese with pie." Like all Europeans he had been taught to eat cheese as any other common article of food, and pie was not in his bill of fare.

The common cream cheese of our market is technically known as Cheddar cheese. It is usually palatable to most persons and is a nutritious article of diet. Our people would be much better off if they would consume more cheese and less tough beefsteak. Our people, however, have never been educated to eat cheese that has been properly made and cured. That is the reason why so many people can not eat cheese without its disagreeing with them.

In America, cheese is made and placed in the curing room, and anywhere from twelve to fourteen days after being placed in the curing room it is likely to be turned on the market.

Cheese to be most digestible should go through an extended curing process in the curing room. This takes time. The casein in old, well cured cheese, by the curing process, becomes far more digestible than that in the new cheese. Age ripens the cheese and makes it digestible. This fact is well understood in Europe, and consequently cheese is not placed on the market there until it is suitably cured. It should be at least three months old before going onto the market. Such cheese is mellow, breaks down more readily in the mouth when masticated, and has a richer flavor than young cheese. Cheese such as Americans usually eat would not be regarded as saleable in cheese eating countries.

What we need in America is a campaign of education among customers. Our dairy schools teach students how to make cheese properly, but up to this time they have apparently had little influence in educating public sentiment to a proper conception of cheese consumption. Even the instructors in domestic economy have said little on this matter.

In view of the fact that cheese is one our most nutritious foods and cheaper than meat, in fact, the importance of educating the masses on this subject can not be readily overestimated. If our people were educated to know good cheese and would refuse to buy the green, immature stuff so largely placed on the market, cheese makers would cure properly and consumers would increase their demands for the product.

Skim Milk for Fowls.

Skim milk is a farm product whose food value is not fully appreciated. It is not generally realized that milk loses little in actual food value by skimming. It is true that most of the fat is removed in the cream, but the most valuable food constituents—i. e., the nitrogenous substances—are left behind in the skim milk. Skim milk not only contains much nutritive material, but this material is in a form which, as a rule, is easily digested. It is not only healthful, nutritious food for man, but it may be fed to calves, pigs and chickens with excellent results. Its composition is such that it may be substituted for part of the grain food, especially corn, of these animals with benefit and profit.

The Indiana Station has recently made some interesting experiments on the use of skim milk for young chickens. Two uniform lots (4 to 6 weeks old) of 10 chickens each (5 Plymouth Rocks and 5 Houdans) were fed from July 11 to September 5 under identical conditions, except that one lot received in addition to the food given the other, all the skim milk they would drink. Both lots were given all they would eat of a mixed food consisting of two parts crushed corn, one part bran, and one part ground oats. They were fed three times a day, except on Sundays, when an increased amount of food was given at the morning and evening meal. * * * Both lots were also given all they would consume of cracked bone, cabbage, lettuce and water, of which no record was kept.

It was found that the lot receiving skim milk made a more rapid and satisfactory gain than the lot which did not receive skim milk. Milk-fed chickens made an average weekly gain of 4.46 ounces; those receiving no milk 2.62 ounces. The most rapid increase in weight occurred at those periods when the largest amounts of skim milk were consumed. The skim milk is considered "especially valuable as a food for young chickens during the hot, dry weather, and becomes of less importance as the chickens grow older and the weather becomes cooler."

The vessels in which the skim milk is fed should be scalded frequently to keep them clean and wholesome.—*Poultry Success.*

In Denver, Col., there were 21 deaths of children in four days and the cause was traced to milk containing formaldehyde. If this is true such work is getting far beyond a $10 fine, and is close to murder.

The Real Thing.

The city boy—There isn't much excitement on a farm, is there, uncle?

Uncle Hi—H'm! You never teached a part weaned calf to drink out uv a pail, did ye?—*Houston Post.*

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

As showing how a small thing may nearly lead to serious results, a Guernsey bull, at the Wisconsin State Fair, was led out to be photographed. The owner who was leading him, wore a white shirt, and as he stated afterwards, the bull had never seen him except with his coat on. The combination of white cloth and bright sunlight seemed to cause a high degree of nervousness, which ended in a vicious attack on the part of the animal. Luckily, help was quickly at hand and the animal was subdued, but under other conditions this simple change of costume might have led to serious results. Taking any liberties with a bull is about as safe as walking around a powder factory with a lighted cigar; one may do it with safety, but the chances are strongly against it.

A STRONG TEXT.

It was the pleasant fortune of the senior editor to be called to address the farmers of LaCrosse Co., Wis., at their annual fair in West Salem, Sept. 2nd. The able Secretary, A. J. Phillips, had prepared a feature out of the ordinary as an accompaniment to the address. He had secured the famous grade Guernsey herd of 20 cows owned by Mr. H. D. Griswold, of that place. These cows, which had earned the past year for their owner, over $100 apiece in cream alone, were ranged in front of the grand stand, and we were told to go ahead and preach to the people the gospel of a better cow. So far as the text was concerned there could not be a better one, and we tried to emphasize and make clear the principles which had made such a herd of cows possible. This entire herd is the result of straight forward breeding on dairy lines, by a man who is a plain but very intelligent farmer. It is a pity that such texts could not be exhibited at every fair in the land.

PRODUCING CLEAN MILK.

Twenty years ago a book advocating and describing methods for the production of clean milk could not have been written, not because there was no necessity for such a book, but because neither the public nor the producers had been educated up to the necessity nor the methods of producing such an article of food.

Experience has shown that there is a direct relation between the quality of the milk supply and the death rate of cities, and recognizing this danger the city is calling for clean milk from healthy cows, produced in clean surroundings. The city doctors are recognizing the fact that dirt and disease are almost synonymous terms, especially where milk is shipped long distances and the dirt of various kinds has the time to perform its work.

They are also recognizing the fact that there must be a co-operation between the producer and the city handler, else no advance can be made towards cleanliness and improved quality of the milk, and there is consequently an attempt on the part of those having control of the city milk supply, to reach out and attempt by means of education, as well as laws, to impress on the dairyman the necessity of greater cleanliness in his methods of milk production.

The methods used in education are shown by a small book just published by Dr. S. D. Belcher, of the Rockefeller Institute, having the title "Clean Milk." The book contains nothing new to those who are familiar with advanced dairy practice, but it is valuable as containing descriptions of the methods that have been successfully employed in producing clean milk and especially in pointing out those practices which may seem innocent, yet which are direct sources of serious contamination to the milk supply.

Under the head of the cow barn, a chapter is devoted to the average and ideal cow barn. The average cow barn needs no description; the ideal cow barn described by the author is comparatively small, accomodating not more than 20 head, with a cement floor, a gutter for drainage, a dust-proof ceiling, a large sky light and ample provision for ventilation.

A single row of stalls is recommended, because in case of disease being present among the animals there is less danger of spreading the infection by coughing, and also with such arrangement the animals can have their heads nearer the windows, and enjoy purer air. The last point would not seem to be of any great moment, if there is a good system of ventilation in use. Also in this connection, we decidedly dissent from the author's statement that "air tight construction is not needed in a cow barn * * * *, A herd of cows in a loosely built shed will thrive better in coldest weather, than if maintained in a tightly built. steam heated barn, and an elaborate scheme for ventilation and the regulation of temperature."

The author writes from New York city, and the winters in that vicinity are notedly mild, whereas winter, in any of the northwestern states, is of the other extreme, and the dairyman who winters his dairy cows in loosely built sheds will find that a 20-below-zero wind will cause a decided shut-down in milk production, as his animals will use expensive feeds to keep warm.

Steam heated barns are an expensive and unnecessary luxury, but tightly built stables, with proper ventilation are a necessity for economic milk production in at least two-thirds of the dairy section of this country. The author is evidently not familiar with the King system of ventilation so common in the west, as he makes no reference to it, and speaks only of overhead ventilation, and advises that an architect be employed where more pretentious barn buildings are erected.

Of course great stress is put on the necessity of cleanliness. It needs no argument to prove that fifthy stables, dirty cows, unclean milkers and more than doubtful milk vessels are objectionable from a standpoint of decency alone, and too much cannot be done towards educating the milk producer and dealer to a realizing sense of the necessity of better and cleaner methods.

Such conditions produce something more than disagreeable odors; they are direct cause of sickness and frequently death, and Dr. Belcher's book is to be commended as an attempt to put into shape, and bring before the public an account of the dangers that result from unclean milk, and the methods that improve its quality.

DOES IT PAY TO MILK COWS OF THE BEEF TYPE?

A good many wise(?) people have endeavored to make themselves merry at the expense of HOARD'S DAIRYMAN because here and there, and at long and rare intervals, some cow nominally belonging to a beef breed, makes a phenomenal dairy record. Several years ago they quoted an instance from the herd at Cornell, where a couple of Shorthorn grades, the pick and remainder of some eighteen or twenty of similar breeding, made a larger yearly record than other cows of dairy breeding in the same herd. It was in vain that we dissected the record, and showed that these were selected animals, that their record covered 365 consecutive days, without any handicap of pregnancy, and that when all conditions were equalized, even these selected cows fell back very decidedly. Year after year this case was cited as proof that the modern Short-horn cow was a profitable dairy animal.

Later, a grade Short-horn cow at the Wisconsin Station made a great dairy record, and there was a grand chorus all along the line, joining in the refrain "HOARD'S DAIRYMAN discomfited"—all the singers oblivious of the maxim, *exceptio probat regulam*' HOARD'S DAIRYMAN, always ready to face facts, secured a photograph of this animal and dispatched an experienced stockman to investigate her breeding and ancestry. The picture showed an animal so far removed from the ideal beef form that she was pronounced a good model for a dairy cow, and the inquiry, where she was bred and raised, disclosed the fact that for many generations her dams had been heavy milkers, and so far from the accepted beef type was her maternal grandam, that her herd and home name was "Old Bones." Her sire, also, although a full-blooded Short-horn, was of decided dairy type. And yet, and to this day, the record of this cow is quoted as establishing the propriety and profitableness of trying to do dairy business with cows not of dairy breeding or conformation.

Again and again, in herd reports and cow censuses, HOARD'S DAIRYMAN has published the facts of actual experience, all tending to prove that there is a constant connection as of cause and effect between dairy form, dairy breeding and dairy profits, and that the beef bred cows or cows of beefy form, although deceptively named dual-purpose animals, are as much out of place in the dairy as a threshing engine would be for hauling a buggy.

We give elsewhere some further evidence to the same effect, gathered by one of Dairy Commissioner McConnell's assistants in Minnesota and printed in the *Dairy Record*, under the title, "A Seven Days' Test of Two Herds." If it be objected that other causes than breed and dairy type contributed to the difference in the yield of these two herds, amounting to an average of 3.23 pounds of butter per cow in seven days, how would it do to suggest that a greater disparity exists in the one herd where 3 grade Holsteins averaged 8.76 pounds butter in seven days and 6 Short-horns averaged only 4.07 pounds, or less than half as much as their dairy bred mates in the same herd, with the same care and the same feed.

Lest it may be charged that we have attempted to bury the record of one of these Short-horns in the tomb of "general averages," let us point out as an exception, No. 9 in Mr. Polzine's herd, a 2-year-old Short-horn heifer whose record is nearly a half-pound larger than that of the grade Jersey 2-year-old in Mr. Huyler's herd, which commenced milking before she was 20 months old. If we admit, out of consideration for the feelings of our dual-purpose, and beef friends, that this particular Short-horn heifer is a better dairy animal than the grade Jersey and is worthy of membership in a dairy herd, where does it leave those other Short-horns? And what sort of a percentage is it, where only one animal out of six makes butter enough to pay for her board?

Is not this another good illustration of the maxim that "the exception proves the rule?" The very fact that attention is sought to be diverted from the five and centered upon the one, warrants the conclusion that "it pays to test a herd" and that it does not pay to fool away one's time milking cows of beef type or beef breeding. It is not profitable to search for grapes among thorns or for figs in thistle patches.

OLEO PREPARING FOR A NEW CAMPAIGN.

It was to be expected, perhaps,—but all the same it has a misfit appearance—that "A Weekly Agricultural and Live Stock Journal," even though edited and published under light reflected from the stock yards and slaughter houses in Chicago, should endorse the claim that the law taxing the fraud out of oleomargarine, has resulted in an annual loss of $33,000,000 to $55,000,000 to the stock-raisers of the country; and that the Massachusetts and Michigan courts have held that it is as lawful to color oleo as it is to color butter.

Neither statement is true, but their constant repetition in some of the metropolitan dailies and certain city farm papers indicates that the Chicago and Kansas City packers, and others whose illegitimate profits have been curtailed, purpose to re-open the contest.

The courts referred to have held, contrary to the true intent and meaning of the state laws they were construing, that a color resulting from the normal ingredients of oleomargarine was not within the prohibition of these statutes. In other words, these decisions tend to the doctrine that only artificial coloration is now prohibited in the states named. But the Commissioner of Internal Revenue and the United States courts are holding that the use of palm oil, either directly or through cotton seed oil, is artificial coloration, and the parties who attempted to circumvent the law of Congress in this manner have been required to pay the 10-cent tax and heavy penalties in addition.

The statement as to shrinkage in a market value of beef cattle is equally fallacious. This is the old argument advanced when the Grout Bill and its successor were under consideration in Congress. "The falsity of the argument," says the *Ohio Farmer* in a recent article, "that the butterine demand for oleo affects the price of cattle has been shown up so often that the subject is getting stale; but still they keep harping on it. They fooled ten western senators, who opposed the butterine law because they were led to believe this story, and they even made a cat's-paw of the National Live Stock Association, which is controlled by western ranchmen. A few years ago the butterine men had this story down pat and figured to a cent what butterine was worth to the cattleman. They claimed it increased the price of the average steer exactly $3 46.

Oleo oil is only produced by a few of the largest packing houses. The census reports show that about three-fourths of the entire output is made in Chicago, Kansas City, St. Louis and Omaha. Large slaughtering markets like Boston do not make any. A special plant is needed, and the process of manufacture is so delicate that it can only be carried on successfully on a large scale, by the

largest houses. It does not appear that the beef trust pays any more for cattle than the small slaughter houses, which make no oleo. A western ranchman who is familiar with the ways of the Chicago stock yards and other western markets, would be so shocked he would need the attention of a doctor, if a buyer for Armour or Swift would come to him and say: "Good morning, Mr. Countryman, that's a nice bunch of cattle you have this morning. Just find out what the little fellows, or these eastern buyers will offer you for them, and then come to me and I will pay you $3.46 more a head. I can do this because our people have an oleo plant, and we can work into oleo or butterine, the fat which they would have to cook into tallow." As a matter of fact, it is a few big little things, like the profit on oleo, that enable four or five packing concerns to control more than two-thirds of the packing business of the United States.

AN UNLIMITED FOREIGN MARKET FOR OLEO OIL.

The butterine law has not compelled the packers to "make tallow of this product," for the simple reason that there is a foreign demand for all the oleo oil that can be got out of all the cattle killed in the United States. For years past the foreign buyers have been taking 80 to 90% of the output of the packing houses. Government records make it appear that we actually exported more oleo oil in 1900 than the entire amount produced in the United States! The census reports on the packing industry make it appear that the total output of oleo oil in the year ending June 1, 1900, was 19,111,120 gallons. If we allow 7½ pounds to the gallon, this would be equivalent to 143,333,400 pounds. The custom house returns published by the Treasury Department, show that in the fiscal year ending June 30, 1900, our exports of oleo oil amounted to 146,739,681 pounds. The census valuation of the entire product in this country was $11,482,542, while the custom house valuation of the amount exported was $10,503,586. There is an offset of a month in the custom house of the fiscal year and the census year, but each covers a full year of twelve calendar months; and it probably takes a month at an average to clear from the seaboard the product of western factories, so that the two years correspond very closely in practical effect.

The whole sum and substance of the matter is, that the big slaughtering concerns, that heretofore made oleomargarine in the semblance of butter and are anxious to re-engage in that business without payment of the ten-cent tax, are owned and managed by men whose sole aim is to make all the money they can, and have never shown any disposition to divide profits with anybody, except the retailers of their oleagenous combination of the fat of beeves and swine with cotton seed oil. They never paid a cent more for the steer or the hog than they were obliged to, or in excess of what exporters and others not in the oleomargarine business paid.

And those exporters and slaughterers of cattle who converted none of the fat into oleomargarine, or even into oleo oil, were not in the business simply for their health, but made, as they were entitled to make, a good profit. They did not grow as rich and haughty and anarchistic as the oleo manufacturers did, but they paid just as much for cattle. In other words, whatever profit there was in the manufacture of oleomargarine—and it was by no means insignificant—did not filter back to the breeders or feeders of cattle and hogs, but was retained to the last penny by the Swifts, the Moxleys and their co-conspirators in debauching commerce and defrauding the consumers of their substitute for butter.

PROF. MCKAY ON FLAVOR IN BUTTER.

That grand old dairyman, Chas. L. Beach,—bless his memory—was once talking to a lot of creamery patrons, and he talked plain, so as not to be misunderstood, just as the DAIRYMAN does. He said:

"A great deal of your milk comes to the creamery in an unfit condition. You know that. I am not going to assume that you are ignorant of your duty. Like myself, you do not do half as well as you know. We both too often sacrifice our conscience to our convenience. We are not full fledged, four squared dairymen yet, making the business and all its demands, our pride, our honor, our chief concern. We keep cows, but how do we keep them? not half as clean as we do our cornfields. Why? Because we do not have half as much pride in our cow work as we do in our corn work. When the creamery patron becomes just as keenly alive to the reputation of his creamery as he wants the butter maker to be; feels his importance in it and his responsibility to it, realizes that one pound of dirty milk will spoil 100 pounds of clean milk, then we will make butter that will beat the whole world."

Now that was the truth and nothing but the truth from the patron's stand point. It was a faithful, honest, brave statement, and faithful, honest men always welcome that kind of talk.

But this business of making fine butter is a very wide proposition. It does not all rest on the farmer who produces the milk. Of great importance is the study of the scientific side of it, the skilled training in the work; the sharpened perception of the taste, the smell, the eye, and all that goes to make what we call expert judgment. It will give us some idea what all this means to read the following extract from the address of Prof. G. L. McKay of Iowa before the last winter's meeting of the Ohio Dairymen's Association.

"The standard of flavor for butter, as most of you know, is practically the same the world over. Butter has what we might term two flavors, that which gives a pleasant sensation to the palate when dissolved in the mouth is called palate flavor; then there is the boquet flavor or nose-aroma, so called from the pleasant flavor given off when butter is passed before the face. I had the privilege at Copenhagen, Denmark, of examining the butter before the judges went over it.

In Denmark, their methods are different from ours, from the fact that they use a different standard. They keep the butter for ten days at the experiment stations before it is scored. It is then divided into three divisions and they have three of their experts pass over it, scoring on the basis of 15 for perfection. These men pass over the entire lot separately, each judge taking a separate division and going over the entire lot. After the judging is completed, the manager takes the average of the three for the score.

There are so many things that affect the flavor that it is almost impossible for me to attempt to describe them. We have butter here to-day (indicating butter on the platform) which scores 97, but I am sorry to say it is an outside tub which scores the highest; we have also some here which, I think, scores about 70, or 70 some odd points, I cannot call off the score accurately, but it is down in the 70's at any rate. I presume that the milk making this butter, was equally as good when drawn from the cow as the milk making the 97 butter. A lesson of this kind is also given in what we call process butter. We have in this country a law regulating process butter.

Has it ever occurred to you that this butter is built on ignorance. It is built on the fact that many of the dairymen are unable to make good salable butter. Butter that sells for eight or nine cents a pound is usually thrown in tubs or a barrel in the back part of the store and is sold in barrel lots to the process manufacture. Milk for this butter was just as pure when drawn from the cow as that used for any butter; the loss is due to the lack of skill on the part of the maker. We have lots of dairy writers and instructors in the country, but that point has not been overcome.

[Not one farmer in a hundred, whose milk makes process butter, ever reads dairy papers or listens to dairy instructors. —ED. DAIRYMAN.]

The places where they have employed government experts to travel through the country and give instruction have made much greater progress than other countries.

For instance, take the province of Ontario, Canada, see the advancement they have made in cheese; the Canadian cheese is standing at the head of the list in the English market. Take Denmark, see the position they hold in the English market on butter. The same is true of little Holland. These countries all have their traveling experts.

So we find there is lots of room for work at the present time. We have no exact method of scoring butter; it is merely the sense of smell and taste. I think, however, I could go into a room and score duplicates practically the same from the sense of smell and taste, but it does not take an expert even, to find the difference between the flavor in this tryer (indicating) and the tryer I will send down to you. (At this point the professor passed around for inspection by the audience two samples of butter.)

* * * * The appearance goes a good way in giving the judge a good impression of the maker. Whenever I find a tub of that kind (indicating the tub scoring 97), I have a good impression of that man right away and I score his butter as high as I can. But take the case of this man where the tub is poor; it is an indication at the outset, of a careless maker. * * * *

WORKING BUTTER.

In Denmark they place the butter in water; they first work the butter for about three-quarters of a minute, just enough to incorporate the salt. Then they throw it into water and allow it to stand for a period of two hours. The water keeps the butter at a uniform temperature, and also aids in dissolving the salt.

Recurring again to flavor. A great many of the bad flavors come in the milk from an external source; germs from the manure being carried on the cow's legs and body, which later affect the milk and produce what is called a weedy flavor. This flavor is largely produced by a species of bacteria called *bacillus lactus aerogenous*. Our bacteriologist found this same germ at his home dairy, producing this typical weedy flavor. We also found that by inoculating our best cream with this species of bacteria, it would produce the same flavor.

Contrast with cut below.

Milk is produced here for direct consumption from dairy of 40 cows. Barn has little provision for light; manure is left in piles at openings, contaminating air and tainting milk.—*Illinos Station Report*

Experience With Abortion.

ED. HOARD'S DAIRYMAN:—The excellent article in the last DAIRYMAN induces me me to give my experience with abortion. During twelve years we never had a very wet summer without more or less abortion in the herd, and one or two times our dairy was about ruined. Ours is a winter dairy. Last summer I used a fly repellent of my own compounding. Three gallons kerosene, one quart pine tar, and one pint crude carbolic acid. The cows were sprayed twice a day with this. The result was quiet and peace while milking. At night the cows that were sprayed did not have a fourth as many flies on them as did those that were not sprayed.

Last summer was the wettest summer we ever knew, but we did not have a single case of abortion, athough every herd around us had more or less. We have used the same preparation this year and to this date are free from the pest. I have given the recipe to others and in many cases there has been no abortion, and in the rest the evil has been diminished. As carbolic acid is strongly recommended for abortion, I think inhalation by the cows has the same effect as giving it in the feed, at least it looks that way.

Below I give the record of our dairy for three years.

YEAR.	No. of Cows.	Lbs. milk per cow.	Receipts per cow.	Cost per cow.	Profit per cow.	Price of milk per 100 lbs.
1899	18	8300	$75.75	$26.90	$48.79	$ 90
1900	16	5323	51.70	19.86	31.94	.94
1901	18	7412	76.83	27.70	49.02	1.05

Tallmadge, Ohio. S. J. B.

Crimson Clover and Bloat.

Is crimson clover more likely to cause bloat than the ordinary red clover? A. W.
Wawarsing, N. Y.

There are no reports, accessible to us, on this subject, and the natural presumption is, "no news being good news," that no specific objections to crimson clover on this score have been observed. However, here as elsewhere, when one is traveling in a new country or sailing uncharted seas, some caution should be observed and frequent observations made in order to avoid possible pitfalls or hidden reefs.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Bran, Barley and Oats Compared for a North Dakota Ration.

Please formulate a balanced ration for my dual-purpose cows. They weigh from 1,000 to 1,300 lbs. I have the following feeds of my own raising: barley, 53 cts.: oats, 30 cts.; speltz, 30 cts; macaroni, wheat, 35 cents in market here; bran I can buy at $14 a ton. I have prairie hay, all the cows want to eat and straw all they can eat.

I have been testing my cream with a 18 c. c. pipette and use 160°F. water to fill up test bottles. An old butter maker tells me that I expand the butter fat. Will the butter fat expand more than the scale test would be? H. I.

Havana, N. D.

In order to arrive at a satisfactory comparison of the relative prices of these different feed stuffs and their relative feeding value, we must first reduce them to similar terms or denominations, and then note the varying percentages of digestible units in each. As we have no satisfactory analysis of speltz or macaroni wheat, or information as to their weights per bushel, we omit them from present consideration, but our inquirer can make estimates for himself, upon the hypothesis that a ton of speltz is about equal in feeding valne to a ton of oats.

Barley at 35 cents per bushel (48 lbs.), is $14.60 per ton; add $1.90 for grinding and the price is $16.50. Barley contains 78 per cent of digestible units and bran 58 per cent. With bran at $14, barley should be worth $18.82 if we disregard the larger per cent of protein in bran. Oats at 30 cents per bushel (32 lbs.) cost $18.75 per ton, or adding as above for grinding, $20.65 Oats carry only 66 per cent of digestible units, and are therefore too high in price to be considered, when bran costs only $14 and barley $18.82.

If these dual-purpose cows are fairly good milkers and have not been giving milk for several weeks, we recommend trying a daily allowance of 4 lbs. bran, 4 lbs. ground barley, a tablespoonful of salt, and hay *ad libitum*—that is all each cow will eat without any waste. For cows capable of yielding 25 lbs. of milk daily, add, if procurable, some linseed oil meal, gluten feed or distillers dried grains—one to two pounds daily.

The test should be read at 140°F., a temperature higher than that, especially in the case of cream where the fat column is long, will give too high a reading. To get accurate results, cream should be weighed, never measured.

Ohio Alfalfa Queries.

Can alfalfa be sowed in the spring with oats, and about what time should the oats and alfalfa be sowed?

Would you put the seed in the drill and sow with the oats or with a hand seed sower after the oats are sowed and cover the seed with a weeder?

How much oats would it be best to sow to insure good conditions for the alfalfa, and how much alfalfa seed to the acre?

I wish to harvest the oats the same as though there was no alfalfa with them. A. L. D.

Quincy, Ohio.

1. Yes, but the better practice is to seed alfalfa without any nurse crop, or at most with a very light one.

2. Seed separately, and as early in the spring as the ground can be worked up into a good, warm tilth.

3. We would not use more than six pecks of oats to the acre, and less would be better, unless the ground is very weedy and the quick-growing oats are needed to hold the weeds in check. Do not use less than 25 lbs. of alfalfa seed to the acre. The thicker stand one can get, the better quality of hay will result.

4. It will not do to let the oats ripen, but they should be cut very soon after heading out, and cured with the young alfalfa for hay. Treated in this way, with a favorable season, a good second crop of alfalfa may be expected the first season.

Feeding Value of Sweet Corn Ears.

What is the feeding value of sweet corn ears compared to bran at $20 per ton? Or in other words can I sell sweet corn at $9 per ton, cobs and husks returned, and buy bran at $20. C. N. T.

Kennedy, ——.

There are no figures of carefully conducted experiments available for answering this inquiry. There is however, a very general misconception as to the feeding value of sweet corn and sweet corn stover. Both are perhaps somewhat more palatable than common corn, but sugar or glucose has no higher feeding value than starch. Personally we incline to the opinion that it would be profitable to sell the corn and expend the proceeds in part, at least, for bran. If no other gain was made, a ton of bran has $2.50 more available manurial value than a ton of corn.

Danger in Pasturing Alfalfa.

I have a lot of 12 acres of alfalfa which has been cut twice, and at this writing it has another crop ready to cut. I have 12 spring calves. Is there any danger of killing the calves if I turn them into the 12 acres? I do not intend to cut it again. I have been told that it was dangerous to put the calves on it. W. A. B.

Marengo, Ill.

From the best evidence that comes to us, and from the great preponderance of all the evidence, we should not deem it safe to turn calves or cattle of any age, on this alfalfa for more than a few minutes at a time, and then only when not wet with rain or dew, and after their appetites had been otherwise partially appeased. The danger is from bloating.

Land Renting for Fifteen Dollars—Milk Selling at Eight Cents.

Can anything be made selling bottled milk 3.5 per cent fat at 8 cents per quart delivered, where man has plenty of clover hay and blue grass pasture, but must purchase all other feed, except some little fodder? Land lies at edge of city limits of a manufacturing town, and rents for $15 per acre.

Or would it be cheaper to live twelve miles away and ship milk to same place? Land renting in this case at $5 or $6 per acre, about 3 miles from railroad.

We are wondering if the first proposition isn't the best when help is so scarce and very high? A man and boy could take care of a large business, if all feed was brought to the barns. Corn, 40 cents; bran, about $16.50; and dried grains at $18 delivered. Could perhaps have room to raise about 150 tons of ensilage, not sure about this. Or could more ground be rented say two miles away from first place to raise ensilage on, at $8 per acre? N.

Illinois.

Whether it will pay to rent land at $15 per acre is a question that cannot be answered by one at a distance, and especially without a pretty intimate acquaintance with the renter. It would not pay—at least that is our present judgment—to pay $15 per acre for pasture or for any kind of common meadow. If one could cut four tons of hay from an acre he might pay $15 rent.

At prices as they have averaged for the last five years, one could well afford to buy all feed, if he could sell milk at 8 cents a quart.

Personally, we should not choose the more distant location at the prices named.

An Oregon Winter Ration.

Please formulate me a winter ration of the following feeds for Jersey cows that weigh from 800 to 900 lbs.: I have all the clover hay and clover silage they can use. I can buy oats at 25 cents per bushel (32 lbs.), or bran at $18 per ton; oil meal delivered here at $30 per ton. I have a chopper to do my own grinding with, at very small cost. My cows have freshened within the last two weeks except two; one of which will freshen in November and the other about Christmas. I expect them to average about 20 lbs. of milk each all winter. M. S. S.

Hubbard, Ore.

This is the proper time of year to plan

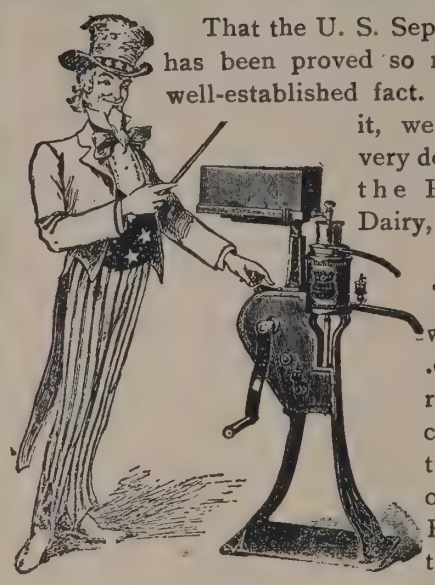
FORCED TO RESIGN.

Lost a Good Position Through Bad Food.

"I felt immediately better after my first meal on Grape-Nuts, which I began to use after my health had broken down and I was a nervous wreck.

My stomach was in such a condition that I could eat nothing and trying to eat was a burden to me.



My pulse ran up to 115 and my weight fell 21 pounds, I got so I couldn't work and was forced to resign a good position. I took milk punches between meals and quit meat altogether, but nothing improved my appetite and the condition of my stomach. I finally went on one meal a day and had to force myself to eat that and was rapidly starving until one day a friend suggested Grape-Nuts.

Although my palate and stomach had rebelled against all other foods Grape-Nuts agreed immediately and I really relished this food while the changes in my condition have been wonderful. My weight increased from the start and I have now regained 12 pounds while my pulse is normal and I am a new person all over. Life seems worth living and I enjoy all my meals.

To make sure that this change was due to Grape-Nuts I made the experiment of leaving off the food for five days but I began to go backwards so rapidly that I concluded I had satisfied my curiosity in this respect and I went back to Grape-Nuts again in a hurry and began to pick up again. Grape-Nuts certainly touched the spot and did the work." Name given by Postum Co., Battle Creek, Mich.

for winter feeding, and especially so with cows that are expected to be at their best between this and January. The treatment, including feed, given the cow in the early part of her lactation period, has much to do with her subsequent usefulness. We think it wise, therefore, to commence winter feeding of fresh cows now.

The presumption is, that these cows have plenty of good pasturage now,—at least plenty of good looking pasturage. With us in Wisconsin, pastures never before looked so well at this time of the year, but we find that the lush grass, consequent upon an excess of rain, is lacking in nutriment. We therefore advise our Oregon inquirer to commence at once with a moderate daily allowance of oats and salt and some of that clover hay. We cannot name any specific amount, for this must be determined by the results as they develop with the individual cows. The presumption is, that about four pounds of oats daily will be a fair average for the present.

When the pastures fail and silage and hay constitute the roughage, increase the allowance of oats to 6 lbs. and add about 1 lb. of oil meal. The amounts of hay and silage must be largely determined by the supply available. We should prefer to have each cow eat about 6 lbs. of hay and then add as much silage as will be eaten with relish.

Seeding to Alfalfa in West Virginia.

We have a field of 5 acres which we plowed as soon as we finished cutting wheat and sowed to cow peas with the intention of sowing in alfalfa as soon as peas come off. They will not be ready to cut for 10 days or 2 weeks yet, and we are afraid it may be too late for fall sowing, so we would like to have your opinion in this case. Do you think the latter part of September is too late to sow alfalfa in West Virginia along the Ohio river? We are beginners in the dairy business and find the DAIRYMAN a great aid. G. W. D.
Graham Station, W. Va.

We are very much of the opinion that it will be safer and better all around to wait until spring for seeding this field to alfalfa. Sow as early in the spring as the ground will work up mellow and warm, and be extra careful to make a finely pulverized seed-bed with the best and richest soil on the surface. Deep plowing. or subsoiling rather, is all right for alfalfa, provided the subsoil is not brought to the surface, but is left where it belongs.

Tests and Yields.

When butter is worth 18 cents per pound and milk tests 5.1, what is 100 pounds of milk worth and how many pounds of butter will 100 pounds make and will you kindly give a table how they figure the tests. A. F. C.
Warren Co., Pa.

There is no table or rule for figuring tests and yields that will apply to the daily results with exactness. In the best conducted creameries and in private dairies the overrun will vary more or less from day to day. Milk testing 5.1 per cent fat will average to yield approximately 5¾ pounds of butter per hundred pounds of milk. Under best conditions it might reach 6 pounds, and at other times, if separator and churn do not work just right, the yield might not reach 4½ pounds.

From these figures our inquirer must himself answer his first question. Is the price named the net after deducting cost of making, or must 2½ to 4 cents be deducted?

Rape Not Cause of Skin Disease in Swine.

Having little experience in hog rearing, I was induced to sow rape for pasture. Came up good and strong. When about sixteen inches high, turned ten sows and a litter of young pigs on it. Sows all got sore ears, and some of the heavy ones got sore udders. The small pigs got backs all sore and seemed to suffer a great deal. Skin peeled off over back. Have you had any similar trouble? How should I have handled the rape crop?
Woodstock, N. B. C. F. R.

Probably the most satisfactory answer we can give in this case is to state that the present writer has had between thirty and forty late spring pigs and their dams running at will in a field of rape all summer, and a more healthy and thrifty bunch of swine it would be difficult to find. Of course, they have had other feed, such as sweet, warm, separator skim milk and middlings, and lately some freshly cut alfalfa for variety.

It is safe to say that rape did not cause the trouble reported and it would be idle to hazard any opinion as to the real cause without more specific information. It looks like a case where some form of "dip" would be required, and possibly some internal medication. If possible, consult some qualified local veterinarian.

For Cows in Milk Eight Months.

Please advise me of best balanced ration for milk production for Jersey cows, in milk about 8 months, and now giving about 8 quarts eachdaily. I have good meadow pasture, and gluten, corn meal and bran, and would like you to fix up for me the best combination for production of milk from these. M. J. W.
Mt. Vernon, N. Y.

Cows that have been in milk 8 months, and are expected to freshen again (as these cows should) in November and December, cannot be expected to continue profitable producers much longer. As long as the good pasture lasts, there can be no better supplementary feed than a few lbs. of good hay daily and from 4 to 8 pounds of a mixture in equal parts by weight, of bran and ground corn with a teaspoonful of salt night and morning. Do not feed so much grain as to cause any cow to lay on superfluous flesh.

The Boy that Lives on Our Farm.

The boy lives on our farm; he's not
Afeard o' horses none!
An' he can make 'em lope, er trot,
Er rack, er pace, er run.
Sometimes he drives two horses, when
He comes to town an' brings
A wagonful o' 'taters nen,
An' roastin' ears an' things.

Two horses is "a team," he says—
An' when you drive er hitch,
The right-un's a "near-horse," I guess,
Er "off"—I don't know which.
The boy lives on our farm, he told
Me, too, 'at he can see,
By lookin' at their teeth, how old
A horse is, to a T!

I'd be the gladdest boy alive
Ef knowded much as that,
An' could stand up like him an' drive,
An' jist push back my hat,
Like he comes skallyhootin' through
Our alley, with one arm
A-wavin' fare,ye-well! to you—
The boy lives on our farm!

ART OF REST.

May be Acquired and Used With Great Benefit.

Complete and restful poise of the body and mind is an art not easily gained.

Perhaps nothing brings one as much content, comfort, happiness and pleasure as those conditions of easy, restful, resourceful and well balanced mind and body, that make of work a pleasure and the daily life happy and peaceful.

The nervous housewife busy with a hundred duties and harrassed by children; the business man, worried with the press of daily affairs, debts, etc., cannot enjoy the peace and restful repose and healthful nervous balance unless they know how.

There is a way. First and foremost the stomach must be consulted. That means leaving off coffee absolutely, for the temporary stimulant and the resulting depression is sure ruin to the nervous system, aud the whole condition of health and happiness rests upon stomach, nerves and mind.

Start with the stomach, that is the keystone to the whole arch. Stop using things that break down its power, upset its nervous energy and prevent the proper digestion of the food, and the consequent manufacture of healthful blood and nerves, brain and tissues.

When you quit coffee take on Postum Food Coffee. That is like stopping the payment of interest and starting on a career where you are loaning money and receiving interest. The good results are double. You stop poisoning the system with coffee and start building up the broken down nerve cells by powerful elements contained in Postum. These are pure food elements ably selected by experts for the purpose of supplying just the thing required by Nature to perform this rebuilding.

These are solid substantial facts and can be proven clearly to the satisfaction of anyone, by personal experience. Try the change yourself and note how the old condition of shatteted nerves and worried mind changes to that feeling of restful poise of a well balanced nervous system.

The managing physician of a hygienic sanitarium in Indiana says that for five years in his practice he has always insisted upon the patients leaving off coffee and taking Postum Food Coffee with the most positive, well defined results and with satisfaction to the most confirmed coffee toper.

The Doctor's name will be furnished by the Postum Co. Ltd., Battle Creek, Mich.

Empire Empire

Eight Years — Fifteen Cows

The Empire Way Makes Cows Pay.

1895 1896 1897 1898 1899 1900 1901 1902

How's This for a Record?

Emporia, Kans., Jan. 2nd, 1903.

Empire Cream Separator Co., Bloomfield, N. J.

Dear Sirs: Have used one of your **Empire** Cream Separators for the past eight years, during which time I have been milking at all times from twelve to fifteen cows. The cost for repairs in the eight years has been only seventy-five cents. I have had experience with other separators but consider the **Empire** superior to any other, as it never caused me any bother. It is easy to clean and has proven very durable. It does good work at all times. L. H. VAHSHOLTZ, Rural Route No. 4.

The Empire Cream Separator turns more easily, is more easily cleaned, does better work, and costs less for repairs than any other, because it is the **simplest separator made.** Don't buy a separator until you have investigated the merits of the Empire.

THE MILK SHIPPER

of all people is best fitted to judge of the merits of a milk can. He knows just what extreme hard wear a can is subjected to, not only in the milk car, but in the city delivery wagon as well. He knows what economy there is in toughness and smoothness, which mean wear, resistance and ease of cleaning. Because of this knowledge he

Has Set the Seal of His Approval

on the **Buhl Cans.** This is witnessed by the large number he has bought in the past and by his **repeated and ever increasing orders.** He never makes a mistake, because he has learned that any milk can stamped with the Milk Can Trade Mark is the best milk can for the money. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. All dealers sell them. Ask for the **Buhl.** Look for the Milk Can Trade Mark. No other Can so good.

A Seven Days' Test of Two Herds.

I have tested several herds this season and find some very good ones, and some very poor ones. The cows that produce the most butter are almost without an exception of the dairy form.

With the permission of two of the patrons will give the record of two herds for seven days.

Will leave it with the reader to decide whether it pays to test a herd, also if it pays to milk cows of the beef type.

—Dairy Record.

Renting a Dairy Farm.

In reply to an inquirer as to what the custom is in renting dairy farms as to the proportion of the proceeds that should go to the renter and the landlord, Mr. Colon C. Lillie gives the following suggestions in the *Michigan Farmer*:

I wish there were more well defined customs in this country about renting farms. In the old countries they have well established customs, and they are seldom deviated from, but our country is hardly old enough for that yet. We are coming to it, however, aud we need some unwritten law on the subject. If we had some well defined customs there would not be so much dissatisfaction between owner and renter.

In general it may be stated that the land draws one-third and the labor one-third. That is, if the tenant furnishes the cows and all other stock and does the labor, he gets two-thirds the crops or receipts from the farm. If the owner furnishes everything, teams, tools, cows, the tenant doing the labor only, then the owner gets two-thirds of the receipts and the renter one-third for his labor. Sometimes the owner furnishes the cows, or in some instances half of them, and the renter furnishes teams and tools; then each takes half the proceeds.

In each instance the stock is fed from the individual products, i. e., each furnishes feed in proportion to his receipts, and if extra feed, such as bran, cotton seed meal, etc., is purchased, each must furnish in such proportion to his share of the proceeds. If the former gets two-thirds of the proceeds, then he pays for two-thirds of the feed purchased. If the renter receives one-half, then he pays for one-half the purchased food, and so on. Of course there are many little details that the owner and renter must agree upon and all should be put in the contract. The owner usually pays the money tax and the renter the road or highway tax. In repairing fences and buildings the owner usually furnishes the necessary material and the renter does the labor. If new buildings are constructed the owner does all, as these will be permanent improvements and will add to the value of the farm. The renter must do all the labor, not only in putting in the crop and harvesting it, but he must market it as well.

I am glad this question of keeping cows on rented farms is being discussed. It is the only correct way of farming in general; we can't keep our land in good condition unless live stock is a part of the farming. Dairying is the only form of live stock husbandry that brings a satisfactory, uniform cash income the year round. It gives the tenant cash to do business with and to live on and it gives the owner cash also. When we come to rent our farms we should insist

"ADVERTISEMENT."

THE VALUE OF CHARCOAL

Few People Know How Useful it is in Preserving Health and Beauty.

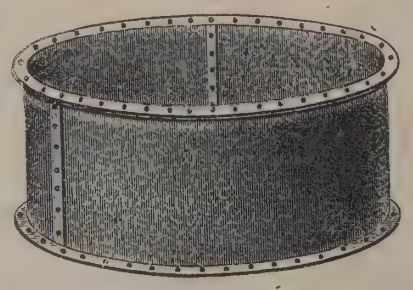
Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.



All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

NEW YORK MARKET.

NEW YORK, Sept. 12—Butter—Receipts for the week, 49,342 packages.

Exports for the week, 560 packages.

There is a good demand for all grades fresh make creamery butter at a slight advance over last week's prices, and at the close the market is firm with receipts well cleaned. Extras were less plentiful and found plenty of buyers at 20¼ to 20½c, and good to fair qualities were in demand from all quarters at 19 to 20c. New York state dairy of finest quality sells readily at 19 to 20c, but most of the arrivals are poor and sold at 15 to 18c. Ladle goods are in light supply and firm. We quote:

Creamery, extra, 20½@21½c; medium, 19@20c; poor, 16@18c; Dairy, extra, 20c; medium, 17@19c; poor, 15@16c.

Cheese—Receipts for the week, 33,981 boxes. Exports, 6,900 boxes.

There was a good, healthy market all the week; best marks of full cream cheese sold at 11c, and in some cases a fraction more was paid for specials. Skimmed cheese had more inquiry with sales of best goods at 8½ to 9½c, and under grades at 5 to 8c. We quote:

Full Cream, extra, 11c; medium, 10@10½c; poor, 6@8c.

Eggs—Receipts for the week, 42,792 cases.

A strictly fresh egg is wanted at full prices. Other grades sold at about last week's quotations: We quote:

New York & Penn, finest selections, per doz, 24@25c: Northern & Western, finest selections, 23@24c; all Sections, poor to good, 16@22c.

177 Chambers St DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Md., Sept. 10.—Butter—The healthy feeling noted in our last report has not abated in the least, but on the contrary the market presents a very firm appearance, and receivers are firm in their views on all desirable stock. Extras are in quick demand, especially long lines, both for storage and consumptive purposes. Firsts are also meeting with prompt sale. Seconds—The supply is about equal to the requirements. Grades under seconds are very dull. Imitation creamery—While in moderate receipt, the supply of the kind is quite equal to if not in excess of the demand. Ladles—Fresh sweet stock continues in moderate receipt; there is an active demand for this kind, while faulty stock is neglected entirely. Packing Stock—The receipts of desirable stock have been insufficient to satisfy the demand; the market rules firm on all attractive offerings, Blocks and Prints—There is a vast difference in the quality of the stock arriving, hence the wide range in values; all choice to fancy arrivals meet prompt sale.

Creamery Separator, extras, 21c; firsts, 19½@20c; seconds, 17@18c. Imitation Creamery, extras, 18c; firsts, 17c; seconds, 15@16c. Iowa & N. W. Ladle, extras, 16¾c; firsts, 15@15½c; seconds, 13@14c; Ohio & Indiana Ladle, extras, 16c; firsts, 15c; soconds, 13@14c. Creamery blocks, (2-lb.) extras, 22c; firsts 21c; seconds, 18@19c: Creamery prints (⅛ lb) extras, 23c. firsts, 22c; seconds, 18@20c.

Eggs—The market has ruled firm since our last report. There is a brisk demand for strictly fresh stock at 22 cents, and all receipts of this kind are promptly placed on arrival; the market closes steady to firm on all desirable stock, either fresh or storage.

Cheese—Receipts fairly liberal; demand good; market rules very firm.

N. Y. State—Cheddars, fine, 11¼@11¾c; choice, 10¾@11c; fair, 10@10½c, Flats, fine, 11⅜@11⅝c; choice, 11@11¼c; fair, 10¼@10¾c; Small, fine, 11⅝@12c; choice, 11¼@11½c: fair, 10½@11c; Ohio Flats, fine, 10¼@10⅝c; choice, 9¾@10c; fair, 9@9½c; Ohio Picnic, fine, 11@11¼c; choice, 10½@10¾c; fair, 9½@10c; Swiss Cheese, (domestic) new, fine, 13@13½c; choice, 11@12c; fair, 9@10c.

For particulars as to territory to which excursion tickets may be sold, etc., apply to agents Chicago & North-Western Ry. 29-sp

The Oleo Situation in New England.

ED. HOARD'S DAIRYMAN:—The information recently given out by Mr. Knight, Secretary of the National Dairy Union, is very gratifying. The fact that there has been more honesty in the sale of dairy products and their imitations, is a cause for congratulation. But unfortunately, I cannot look at the situation as optimistically as does Mr. Knight. Though the figures—and figures won't lie—show a falling off in the consumption of oleomargarine, I am inclined to think that this if analyzed, is due to a straightening out of some of the dishonesty, where there was no anti-color law and no pretense at doing an honest business. I cannot help the feeling that so far as New England is concerned, there is as much yellow oleo sold as at any time during the last half dozen years; perhaps I should say that more yellow oleo is sold now in New England, than there has been at any time within recent years.

A few months ago, I went into a Rhode Island butter store where there were several tubs of butter(?), each with some label or advertisement over it. I put on my most innocent face, and called for a pound of butter, from the tub labeled "Best New York Dairy, 28 cents." It was oleo, in imitation of butter; whether it had "artificial" coloration I do not know; but imitation butter was being openly and deceptively sold, as and for butter at 28 cents a pound. A few weeks ago I went into a butter (?) store in Hartford, and found several tubs of oleo placarded as butter, with different fancy designations. Oleomargarine in imitation of butter was being sold openly as butter with no mark or sign to show the stuff was not butter—barring the revenue stamp, which no ordinary purchaser could see.

In Massachusetts colored oleo, in imitation of butter, but without "artificial" coloration, is now sold openly and without restriction. This is largely due to a ruling of one of our superior court judges. Our law prohibits the sale of imitation butter, and heretofore in prosecuting cases we have charged the defendant with selling imitation butter, have proved the sale, and that the substance sold looked like butter, but on chemical analysis proved to be something else, and on that evidence have secured conviction. But there is a proviso or exception in the law allowing the sale of oleomargarine when free from coloration, which causes it to look like butter. The prosecution has never paid any attention to this proviso, claiming that all we had to do was to prove the direct and positive side of the case, and that it was then up to the defendant to set up the provisions of this exception—if they applied in his case—and prove them. This contention has been upheld by the lower courts for years, and the oleo people have never thought it worth while to carry the point up to the Supreme Court for a final and decisive decision.

But a few weeks ago a superior court judge ruled that the proviso meant that the oleomargarine must be free from "extraneous" coloration which causes it to look like butter, thus putting into the law a word which is not there. He also held that the prosecution must prove that there has been a sale of imitation butter free from extraneous color. As the government cannot appeal in this state, that case is ended, but it is expected to arrange for a test case before some other judge who will rule differently, and then the oleo interest can appeal and we can get a decisive opinion on this anti-color law, which stood the constitutionality attack before the National Supreme Court.

Michigan has an anti-color law copied verbatim from the Massachusetts law, and this point has just been decided by the supreme court in that state, adversely to the honest butter interests, and along the lines of the view of the Massachusetts judge above alluded to. The case is Bennett vs. Carr. The court says: "At the time the statute in question was enacted, the only method in use in causing oleomargarine to look like yellow butter was the introduction of some extraneous coloring matter. This was the mischief to be remedied. . . . If we give the enlarged construction to the statute now in question, as urged by the relator, it follows that the legislature has prohibited the manufacture and sale of a valuable article of food, the natural color of which resembles yellow butter, itself almost universally colored by extraneous matter. The manufacturer of such a product, if he sold it at all, would be compelled to introduce some coloring matter, so as to make it look unlike the yellow butter of commerce. . . . .

It (the law) does prohibit the use of any substance for the sole purpose of producing yellow color. The use of such coloring matter was the sole mischief then known to exist, and the only danger to be apprehended and guarded against. Our statute is copied *verbatim* from that of Massachusetts. The supreme court of that state in a case just decided, has held that the statute applies only to extraneous substances or ingredients which cause the product to look like butter and not to cases where the ingredients themselves naturally produce the color."

Now here is an interesting question. The Massachusetts supreme court has made no such decision, as stated above. Who imposed upon the supreme court of Michigan by giving it this misinformation? Have the oleo lawyers been lying to the Michigan supreme court? The statement must have come from them. Are these professional men so zealous in their desire that the dear public shall have this "valuable article of food" that they will go to the extent of deceiving the supreme court of one of the largest and best commonwealths in the nation to carry their point? It is the lawyer's business to make arguments for the side that puts money in his purse. Everyone understands that he is in the market for sale to any purchaser, but never before did we have reason to suppose that his professional loyalty to his client went so far as to require him to manufacture facts.

MASS. GEORGE M. WHITAKER.

Growing Hairy Vetch for Seed.

The following information relating to the growing of the hairy vetch for seed, is furnished by the Bureau of Plant Industry of the U. S. Department of Agriculture, through its Seed Laboratory, in response to numerous inquiries on the subject:

The cultivation of hairy vetch has increased rapidly in the last few years, and would be much more common if the seed was raised in this country, and especially on the farms, where it is to be sown.

Practically all the seed now used in the United States, is imported from Europe. During the fiscal year ending June 30, 1903, over 80, 000 pounds of this seed was brought in.

Experiments have been carried on by the Seed Laboratory of the Bureau for two years in St. Mary's county, Maryland, and the past year in Wayne county, Ohio, to determine the practicability of growing seed in this country. From the results of these trials, it is evident that the seed can be produced at a profit over a wide area of the United States.

Great difficulty has been experienced in harvesting the seed when grown alone. It ripens very unevenly and if left until most of the seed is mature, it becomes matted on the ground, and shells and molds badly. It was found that by sowing with rye, a sufficient support was furnished to keep it off the ground and allow it to be cut easily with the mowing machine. Rye seems best adapted as a supporting crop, on account of the time of ripening and the stiff straw.

The best results were obtained with seeding from one-half to three-fourths bushels of vetch and one-half bushel

CHICAGO HOUSE WRECKING CO., West 35th and Iron Street, Chicago.

of rye to the acre, sowing from the middle to the last of September.

The crop should be cut about the time the last pods are formed and the vines are getting dry. The cutting is done with an ordinary mowing machine, after which the vines and straw should be put in piles and allowed to dry. The threshing can be done with an ordinary grain threshing machine.

The 4 acres in Ohio yielded 13 bushels of vetch and 61 bushels of rye. In Maryland the storms knocked the rye down so it did not fill well, but the 4 acres yielded 18 bushels of vetch and 8 bushels of rye. Reports from Mississippi show a yield of from 5 to 7 bushels per acre in that State.

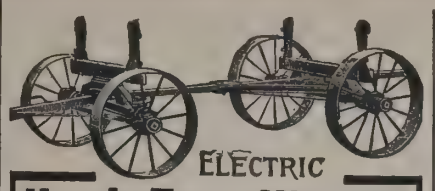
In many instances hairy vetch has been sown and proved a failure under ordinary cultivation. As it is adapted to a considerable variety of soils and a wide area, it is certain that the failure in most instances is due to the absence of the organism which produces the root tubercles, and has the property of fixing the free nitrogen in the air, making it available for plant food. In sowing the areas referred to above the greater part was inoculated with the nitrifying organism, but a strip was left in each case on which none of the inoculating material was used. A vigorous growth of hairy vetch was obtained on the inoculated plots, while on the uninoculated plots in both cases the growth was very scanty and the ground almost bare. This shows the ability of the vetch to make a very satisfactory growth by means of the inoculation on ground where it proves an entire failure under ordinary cultivation.

Unless hairy vetch has already been grown successfully on a piece of ground, it should be inoculated to insure success. Inoculating material will be furnished by, and all inquiries concerning it should be addressed to, Bureau of Plant Industry, U. S. Department of Agriculture, Washington, D. C.

The Department has no seed of hairy vetch for distribution.

The Interstate Live Stock Fair.

ED. HOARD'S DAIRYMAN:—The Interstate Live Stock Fair has just been brought to a close. In every respect it has been a very successful fair. I enclose a list of the competitors and their scores. There were 49 creamery and two dairy exhibits. The average score was 94.6. This surely proves that this is one of the finest lots of butter on exhibition this year. This will also be readily understood when you glance over the score list as you will see that nearly all of the prize winners from Iowa and Minnesota have made an exhibit.



There is $460 to be divided among those who scored above 92. Beside the money premium, Mr. Sondergaard will be awarded gold medal and W. S. Smarzo silver medal.

The dairy hall was beautifully decorated. The supply men present claim that they have never seen a dairy hall so tastily decorated as this.

A Bad Milk Day.

ED. HOARD'S DAIRYMAN:—Eternal vigilance is not always the precursor of victory. It certainly is not so in the dairy in early September. The greatest "schemes of mice and men gang aft aglee," as the great Scottish bard said. The milk flow will go down notwithstanding all your human care and attention. Man is not mighty, and these failures and disappointments only go to tell us that we here below are not omnipotent, but just simply "Little wanton boys that play with bladders;" and is one of the strongest arguments against Darwinism, agnosticism, and in favor of the immortality of the soul, the presence of the all-powerful being and a hereafter, where (for the good) the wicked cease from troubling and the weary are at rest.

Flies and heat are two things that cannot be always combatted successfully. Yesterday was one of those days when they were rampant. It was the worst day for milk this season. Not because it was the very hottest day of the season. There were others; and the flies too were perhaps as bad, though we are not sure. But when dry pastures are combined with flies and heat, here is a triumvirate that it is almost an impossibility for mortal man to compass. It was so with us yesterday, when we had the complete triumvirate, heat, flies and seared pastures, and notwithstanding our best efforts, we had the smallest milk flow of this season, some two pounds per cow less than the previous day, or average of the week.

In the morning we anticipated the heat and flies and did our very best to fight them. We gave the cows a good feed of ground oats and corn, and after milking had a can of kerosene emulsion, and very carefully went over each cow with the spray, and rubbing the mixture on every vulnerable spot along their bodies. They were then sent to the field, where they had opportunity to drink as they went along. About ten o'clock, however, the heat became violent. The cows could not stand under such heat and feed. There are some old buildings in one of the pasture fields, and they usually go in there on hot days. We thought they would seek this protection yesterday, and no doubt they did for a while.

Along about two o'clock, we went to the field to see if they got water in the lower pasture where the stream was small and the flow of water such that we usually have to stand by them for a time, as, otherwise, all might not get water. As we were going to the field we met a number of cows coming at a dead run, with tails up in the air, and in a most excited condition. With some effort we turned them back, as we wanted to drive them to a spring where there was a cool place. As we did they turned, and off they went back around the field in a stampede that would do credit to an old time prairie buffalo stampede, tails high in the air, snorting and apparently making a record race against time. We got them to the water, but they were too excited to drink. Some of them walked into the water to cool themselves, but would not drink, which was in itself very strange. Here they had some shade, and we left them.

About five o'clock we noticed them grazing. We believe they grazed none all day until this time. Notwithstanding that we used the repellent, we noticed that two of the cows were covered with flies, while strangely enough, we noticed scarcely any flies on the others. All got an equal wash of the emulsion in the morning. Why it was apparently effective on some of the cows and not on the others appears a little mysterious. The repellent appeared to dry on those cows which were covered with flies, though the soap in the mixture makes a kind of a crust. From this we inferred that those cows which appeared to be covered with flies, had stood in the hot sun more than the others, permitting the fly preventive to evaporate and dry up. We noticed two cows going along together, each of which received equal care in spraying, that one side of one was black with flies and not a single one appeared to be on the other. The best fly preventive will not prove a sure thing on such a day a yesterday.

At five o'clock when the cows came to the stable, it was nice and cool. We had placed in the mangers the largest feed of green barley that we gave them this summer, and in fact we thought they might leave some of it. They

OLD BUGGIES MADE NEW

by using our wheels, which we furnish painted any color desired, with boxes set so they will fit your buggy or carriage perfectly, ready to put on the vehicle and drive away. We will fit the wheels with any standard make of rubber tires, if desired, and show you **FREE** how you can paint the vehicle any color just as well as if done by a professional carriage painter. We guarantee the wheels for one year and warrant the spokes not to get loose in the hub and the rims not to split.

We are the largest vehicle wheel manufacturers in the world. We own 45,000 acres of the best hickory forest in existence, from which we take all the timber used in our wheels. Send us the address of your blacksmith or carriage builder and we'll tell you how you can fit your vehicle with new wheels for little money.

MUNCIE WHEEL & JOBBING CO., 121 Ohio Ave. MUNCIE, IND.

F. TSCHUDY & SONS, Monroe, Wis.

didn't, and would have eaten much more. The fact was, they scarcely ate any all day. When we began milking the outcome was as stated, about 2 lbs. to 2½ lbs. of falling off per cow. One cow, the "old 15-year-old," was 5 lbs. short, "the little heifer" was barely 2 lbs., while our best, our "No. 6," was more than 2 lbs. off; another was 4 lbs. (the one spoken of as being covered with flies on one side of her body,) while two of the had actually their usual mess of milk. This morning all the cows milked normally again..

We think we made a mistake in not permitting the cows to come on home as they intended at two o'clock, instead of turning them back. Had we permitted them to come to the stable then, and given some green feed, we would probably have done better, though this would hardly make much, if any, difference in the milk yield, two or three hours later. It would have been more humane however, though we left them in not too bad a place.

Later; since writing the above we have seen the milk drawer, and he reports the lightest load of milk this season. The heat, flies and seared pastures, evidently were universal in their effects yesterday. J. A. M.

P. E. I.

He Thinks We Have a Difficult Task.

ED. HOARD'S DAIRYMAN:—Your paper interests me very much. You are honest, straightforward, and know what you are talking about. But you are figuring on the American farmer in the wrong direction. You think there is going to be a large class of farmers, like yourself, who will make a special study of the cow and the dairy business, and who will try and build up their knowledge in that direction. I doubt it. Most of the farmers, dairy farmers as well as the rest, despise their business. Their wives despise it; the daughters despise it, and the sons despise it. What can the farmer do but despise it? You will hear him say that he hopes his son will not have to work as hard as he has had to, and the mother says the same about her daughter. There is no class pride or class spirit among the farmers. What they want most is to get off the farm as soon as possible, and move into some small city or village, where they can live without work. Work, they take it, is the great shame, and humiliation of humanity, the one thing that marks a slave and the absence of it, makes a gentleman. How then can you ever hope to build up a class of American farmers who will take as much pride in being farmers as lawyers do in being lawyers or doctors being doctors? H. C. R.

Oneida, N. Y.

What do our readers think of the above?

Frosted Corn for Silo.

ED. HOARD'S DAIRYMAN:—Referring to your opportune and "orthodox" article, *re* frosted corn, in your last issue, please let me, in my little way, back up your statement that you "prefer to let the corn be frosted rather than cut it into the silo before it is properly matured." In my experience of ten years, as manager for the late Mr. E. D. Tillson of Canada, we put up yearly about one thousand tons of ensilage and I found immature corn always proved unsatisfactory and has not the nutriment in it. One season we had about 10 acres badly frosted. At once started to cut, haul to barn and put through cutter, watering the corn by sprinkler connected with hose, as it passed up the carriers. Result: Good, fair ensilage next spring.

It is important to note that water must be used. J. D. McL.

Madison Co., N. Y.

Siloing Oats and Peas.

ED. HOARD'S DAIRYMAN:—Replying to "E. J. S., Chautauqua, N. Y.," *re* above, allow me to state that while manager on the Annandale farm in Canada, I found oats and peas put in silo make excellent feed. Much care must be taken, however, in having the crop *good* and *moist* when put in, and I see Mr. E. J. S. has done this. He may safely anticipate sound feed in spring. Please report result. JOHN D. MACLEAY.

Madison Co., N. Y.

HOLSTEIN CATTLE! The Choicest Milk and Butter Breed in the World. Write to WISCONSIN LIVE STOCK ASSOCIATION, Appleton, Wis., U. S. A.

LOVE

Often leads to poverty. No real woman ever sold her heart for the luxuries of life. But many a woman who has gladly faced poverty for the man she loved, may well doubt her wisdom when pain becomes the mate of poverty. If she were rich, she thinks, she could find a way of cure.

Dr. Pierce's Favorite Prescription is within the reach of every one. It lifts the burden of pain which weighs down those who suffer from womanly diseases. It establishes regularity, dries weakening drains, heals inflammation and ulceration and cures female weakness.

"You have my heartfelt thanks for your kind advice to me," writes Mrs. Geo. Fletcher, of 106 Victoria Avenue, Galt, Ontario. "Was troubled with catarrh of uterus for over a year. The doctors said I would have to go through an operation, but I commenced to use Dr. Pierce's Favorite Prescription and 'Golden Medical Discovery,' also his 'Lotion Tablets' and 'Antiseptic and Healing Suppositories.' Now I am completely cured, after using six bottles of Dr. Pierce's medicines. I am glad to say his medicine has made me a new woman."

Weak and sick women, especially those suffering from diseases of long standing, are invited to consult Dr. Pierce by letter, *free*. All correspondence is held as strictly private and sacredly confidential. Address Dr. R. V. Pierce, Buffalo, N. Y.

Dr. Pierce's Pleasant Pellets are easy and pleasant to take. A most effective laxative.

LOOK HERE
34 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs. of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs. of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Grem Pietertje Hengerveld Paul De Kol, or Sir Ormsby De Kol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days; average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd?

The Farm Separator System.

ED. HOARD'S DAIRYMAN:—You comment editorially on the Farm Separator System in your issue of August 14, 1903, and it seems to the writer that you bring up some very interesting matters.

The idea you suggest is, that while the hand separator system may lower the average quality of creamery butter, still it may not be an unmixed evil, as the patron's returns will be proportional to the care he gives his cream, and he will be thereby encouraged to produce a better cream. You refer to the time when each farmer made and shipped his own butter to the Chicago or other market, and the commission man returned him on the basis of what his butter was worth, which, of course, prompted him to an improvement in quality.

The contention of the writer is that just such a plan should be adopted with the cream buying business at the present time.

The matter of the lowering of the average quality of creamery butter by the introduction of the hand separator is very serious, and it is all the more because the danger is being minimized by some of our creamerymen who know better (or should) and who will later feel the evil effects of their desire to temporarily profit themselves at the expense of the business in general.

The writer has lately visited a number of the large centralized creamery plants that are receiving cream from hand separator patrons, either by direct shipments or through receiving stations, and there can be no doubt whatever that they are making a very ordinary and sometimes inferior grade of butter, and this state of affairs has been brought about very largely by the cream from the hand separators being of such poor quality. Nor does there seem to be any organized effort by the creamerymen to correct or lessen the trouble. Thousands of hand separators are being sold over almost all the dairying districts, and it really begins to look as though their use would become universal with creamery patrons everywhere. These machines are costing the patrons an average of $100, and, practically without exception, we find them pleased and satisfied with them.

In spite of the fact, however, that the patrons like the hand separator, there can be no doubt that as at present handled they are working an injury to the quality of the creamery butter made from this hand separator cream. The patrons are delivering a poorer quality of cream than they formerly did milk, and the quality of the butter is thereby lowered.

Very few creamerymen seem able to cope with the problem, most of them paying the same price for low as high quality cream, and of course this method of payment is sure to still further lower the quality of the receipts. A number of our large companies recognize the seriousness of the situation, but are deterred from any reform by the fact that their competition, which may be sharp, has not yet learned the lesson, and are willing to pay the same price for poor as for good cream. This makes it very hard for any proprietor, who has the good of the business at heart, to adopt any reform that will cure the evil.

It occurs to the writer that now is a very good time for creamerymen to consider these matters, and to shape their policies so that the healthy growth of the business will not be injured or interfered with. The writer believes that by taking the proper precautions the evil of poor cream may be gradually annihilated. The cream when received should be carefully inspected and graded. Sweet, clean-flavored cream, properly handled, will make extra creamery butter; cream received from different patrons slightly sour, with smothered or other off flavors will make firsts; while rank, old, bad flavored cream will make a second. On the Chicago and New York butter markets a first is worth on an average of one cent less than an extra, while a second is worth at least three cents less than an extra.

I believe the different qualities of cream should be termed "extras, firsts and seconds," the top price being paid for extras (not one-half cent above), one cent less for firsts, and at least three cents less for seconds than for extras. We can then go to our patrons in good grace, and give instruction as to how to care for the cream; we can urge daily delivery, should that be necessary to make it grade extras, and I believe that nothing

All Kalamazoo ranges and cook stoves are equipped with patent oven thermometer. Makes baking sure and easy.

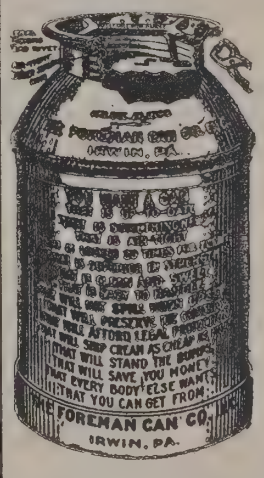
The KALAMAZOO

A better stove or range than you can get from any other source. A saving of from 25% to 40% in price. Prompt shipment from factory to user. Factory prices—no dealers' profits. Freight prepaid by us. 360 days approval test. Guarantee backed by $20,000 bank bond.

KALAMAZOO

Stoves and Ranges are manufactured by us in our own factory. We know they are all right "clear through." Don't confuse them with cheap mail order goods.

We are the only stove manufacturers in the world selling their entire product direct from their own factory to the user.



There isn't a better stove or range at any price and by eliminating all dealers' and middlemen's profits we save you easily 25% to 40%. Moreover we give you a 360 Days Approval Test. If your purchase is not satisfactory in every way, return the goods at our expense. We have a complete line of ranges, cook stoves and heaters for fuel of all kinds. All stoves blacked, polished and ready for business.

It will pay you to investigate.

Send for catalog No. 163 and prices, freight prepaid.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

ing else will so inspire the patron to care and cleanliness as this simple classification that hits him in the pocketbook if he does not care for his cream as he should.

As stated before, many of our creamerymen who are now buying hand separator cream, are afraid that any change of plan will lose them business, and unless the creamerymen competing can agree on a classification somewhat as outlined above, of course any change will have to be slow. However, I think that no one familiar with the business will deny the importance of reform in the lines indicated, but like many other reforms we cannot expect to reach perfection at once. E. W. CURTIS.

Topeka, Kan.

Siloing Whole Corn.

ED. HOARD'S DAIRYMAN:—Noticing in your issue of August 28, G. L. S.'s letter about filling his silo with whole corn, I am prompted to write and say that there are a number of dairymen in this section who have filled their silos with whole corn with perfect success for many years.

Most of them use a hay fork and carrier to elevate the bundles and drop the load in the center of the silo, keeping a man there who lays the bundles in regular courses, the first with buts out, the next with tops out, alternating all the way up. Every second or third course put an extra bundle or two along the edges against the outside, and tramp down the corn all the time. Be particular about keeping the edges well filled. After corn is all in, some of them pour five or six barrels of water over the top.

When the corn comes out, it can be taken in reverse order and comes out in perfect shape, the bundles not broken, and as fine ensilage as one could wish to see. I have heard of one or two who have thrown it in expecting to cut it out, but they never did it a second time.

People who put it in this way say they save the expense of cutting and get as good, if not better, ensilage than if cut. I would like your opinion on that point.

Utica, N. Y. L. C. W.

As we have never fed whole corn silage, it would be eminently foolish to give any opinions as to its quality.

A Dairyman's Good Income.

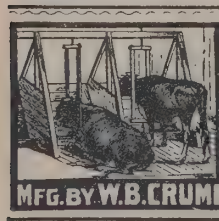
The following experience of a successful Wisconsin dairyman was related at the recent meeting of the Guernsey Breeder's association at Athens, Wis., by H. D. Griswold of West Salem, Wis.

"Choose a herd sire that has a mother and a grandmother and as many more relations as possible that were good milk and butter producers," advised Mr. Griswold. "Get the very best you can. Then get a scale and a Babcock test and know what each cow is doing. Cull out the poor ones and keep the best always. Keep up that practice with your heifers. You cannot buy good cows; there is only one way to get them, and that is to raise them. Then comes good feed and plenty of it, warm and well lighted stable and constant, careful care.

"Now to illustrate along this line I will give you a little of my own experience. In 1889 I bought my first Guernsey sire. I had then one Holstein cow, one Jersey and three or four Shorthorns. I find by my books that my total receipts for butter that year were $138.86. In 1891 I got a Babcock tester, the first one that ever came to our town. I found that year that my cows were making 365 pounds of butter each; I then had nine. I increased the number till in 1902 I had twenty-one cows. I have increased the average production per cow to 424 pounds each. I have increased my receipts from $138.86 in 1889 to $1,937.43 in 1902.

I now have twenty-five cows, and in the month of May just passed we got 5,700 pounds of cream, testing twenty per cent butter fat, with no other feed than grass and a little ensilage. These twenty-five cows are all grade Guernseys but five. I have three Jerseys and two full-blood Guernsey heifers. All but three were raised by myself on the farm and have never been off the place. Six of the twenty-five are two-year-old heifers.

"I tell you this not to boast, but to let you know what we are doing today, instead of giving you some has-been tale. We have the same little fifty-acre farm than we had in 1889, but we have built onto the barn four times, have built two silos, and the farm is increasing in productiveness. But you will say it has



$1.00 BIG 500-POUND STEEL RANGE OFFER.

If you can use the best big 500-pound steel range made in the world, and are willing to have it placed in your own home on three months' free trial, just cut this notice out and send to SEARS, ROEBUCK & Co., Chicago, and you will receive free by return mail a big picture of the steel range and many other cooking and heating stoves, you will also receive the most wonderful $1.00 steel range offer, an offer that places the best steel range or heating stove in the home of any family, such an offer that no family in the land, no matter what their circumstances may be, or how small their income, need be without the best cooking or heating stove made.

ABORTION IN COWS

ABORTION consists in expulsion of the offspring before it can live independent of the dam. Abortion, when not due to specific causes, results from blows, injuries, poisonous blood disorders, exposure to cold, sudden excitement, anger, odors from slaughter houses, or from other animals similarly affected, purgatives and improper nutrition. Smut, ergot and decomposed materials of any kind, when taken as food often cause abortion.

Anæmia, another word for poverty of the blood, is probably the most common cause. Coarse, innutritious food reduces the vitality of the dam, the circulation is sluggish, the blood supplied to the calf, colt, lamb, or pig is deficient in quantity and poor in quality.

These conditions above are often sufficient to cause a cow to lose her calf or a mare to lose her foal and if aided by excitement, a physic, a fall or a chill abortion is almost sure to follow. In all animals carrying young, good nutritious food must be supplied to nourish dam and foetus. Tonics are required, and quiet, clean quarters must be provided, and grain or hay affected with smut or containing ergot must be avoided.

Anæmia, being one of the most common causes for abortion in animals, is not easily noticeable. Animals showing extreme debility of the muscular system, becoming easily exhausted upon slight exertion are generally anæmic, and no better tonic can be applied than Dr. Hess Stock Food. It contains the tonics and salts of iron essential for the improvement of impoverished blood.

This stock food is formulated by Dr. Hess (M. D. D. V. S.), and is used by eminent veterinarians and endorsed by leading colleges. If they know of nothing better it must be good. Dr. Hess Stock Food, the scientific compound, is sold on a written guarantee, 100 lbs. $5.00 (except in Canada and on Pacific Slope), smaller quantities at a slight advance. It is fed in a small dose.

For every disease and condition for which Dr. Hess Stock Food is not recommended, the little yellow card in every package entitles you to a letter of advise and special prescription from Dr. Hess.

Dr. Hess has written a book on the diseases of stock and poultry. It is consulted and commended by many leading veterinarians.

Write Dr. Hess & Clark, Ashland, Ohio; state what stock you have, what stock food you have fed, also mention this paper. For this information you will receive this valuable book, with which you will be able to treat your own domestic animals.

Stops Chills **Painkiller** (PERRY DAVIS') Cures Cramps

"Just as good?" "Just as good!" Did you say? "Just as good as Veterinary Pixine!!" The dealer who tells you that is mistaken. He does not know

FACTS AND TESTS PROVE IT!

Emery, Ky., April 9, 1903.

I feel it my duty to tell what Veterinary Pixine did for a horse of mine. He was cut with a knife between the fore legs three inches deep and two inches long, which every minute would gap open. I used several different kinds of remedy without success, even to having some stitches taken. Nothing did any good and it kept swelling and became feverish. I almost gave up hopes of getting him well. In the columns of the Ohio Farmer I observed your advertisement and, as it was the last chance, I purchased a box at the druggists and used it as directed and before the box was used up the cut was entirely well. I intend to keep a supply on hand for emergency cases if I have to pay a dollar a box for it. Please accept my thanks for the good I have received from its use, and if you choose you can use my name and testimony.

W. S. CAMPBELL.

This penetrating, stimulating, soothing, absorbing, antiseptic, healing ointment heals from beneath the surface by disinfecting the parts, subduing inflammation and stimulating healthy granulations, not by drying and scabbing, and stimulates growth of hair, natural color. Makes quick, clean and healthy cure; heals stinging, burning, chronic saddle and collar galls, hopple chafes, abscesses, caked bag, cow pox, and hoof rot. It penetrates, stimulates, soothes and heals while horse works. Money refunded if it fails.

Price, 2-oz. box 25c; 8-oz. box 50c; 5-lb. pkg. $4.00, at all druggists and dealers or sent prepaid.

Land Above Ditch?

Its only hope is effective and economical pumping. You can raise water where you want it with the

RIFE Hydraulic ENGINES.

Will fill a storage tank any height above the source of supply, when water may be drawn through buildings, dairy houses, stable, yards, etc., by gravity process. It runs itself. Will force up pure water of a spring with muddy water without mixing. Write us your needs and we'll send plans and estimates of cost.

RIFE ENGINE CO., 126 Liberty St., New York.

taken a long time, over ten years. True, but you have to work at something, and dairying is no harder than any other work. The land must be kept up with some kind of stock, and what can you do better? Did you ever think that an income of $2,000 on a little farm in the country is better than twice that in the city? Then the boys are interested in good stock, as they cannot be in scrub stock. And this daily association with these dumb animals makes a man better. He has to anticipate their wants; he has to take lots of steps and do countless little things for their welfare and comfort, and these daily duties make him more thoughtful of others, and he becomes a better husband and father and citizen.

For Cows in New Mexico.

We have 30 head of milch cows and expect to milk about 20 all through the winter. We have green pasture all but three months during winter, and then have alfalfa, wheat and oat hay—all first-class; also some green corn fodder. What would be the best grain to feed for both quality and quantity? Bran, barley and shorts sell at $25 per ton, which of course is very high. A. M. K.

Las Cruces, N. M.

If the feed called "shorts" is really a good quality of middlings and not largely re-ground bran, as is too frequently the case, we should say, feed a mixture, equal parts by weight, of the bran and shorts. Otherwise mix bran and barley in same proportions, or, when feeding alfalfa hay, feed barley alone. Also save the alfalfa hay as far as practicable for the cows giving milk. The amount of of grain to be fed must be governed largely by circumstances; that is, by the ability of each cow to respond. A cow that will not give more than 15 lbs. of milk daily, should have decidedly less grain than one that yields 20 or 25 lbs. And withal, which is a matter that appears to demand constant repetition, do not omit to give salt every day, or better yet twice a day, a good teaspoonful each time.

VETERINARY.

The Small Farmer and the Silo.

ED. HOARD'S DAIRYMAN:—The article of J. G. S., from Bakerfield, Kern Co., Cal., causes me to take pen in hand once more. I do not remember just what the pen caused me to say about alfalfa in Butler Co., but I have distinctly in mind what I wanted to say, and why I wanted to say it. I wanted to say that in my opinion, after seven years' trial, the climatic conditions of the corn belt were most favorable to the successful growing of alfalfa; that the burden of the crop was to be able to cure it, if it was cut as soon as it should be, that is, as soon as any of the bottom leaves begin to fall.

And I would like to convince any "Doubting Thomas" living in said corn belt that he can grow it successfully if he has suitable land. My experieuce says the valley land along our small streams, whose variation on the water gauge is less than 8 feet, is the ideal home of alfalfa, although it can be grown profitably elsewhere. But in this land of fogs and dews and frequent showers, I would say, let every man provide himself with silos. Especially upon the small farmer and stock grower do I wish to impress the wisdom of filling our silos with clover, alfalfa and such. We use no cutter, but handle the crop like hay, and use the same tools, being sure to keep the material thoroughly spread and well packed at sides, and, to secure capacity, fill slowly as it nears completion, for the settling is wonderful. Lastly, cut early and fill without wilting.

I believe there are many of the smaller crops, especially the legumes, that can be successfully siloed, and with much less expense than corn. I am aware that some good teachers, like HOARD'S DAIRYMAN and Prof. Henry, have some skepticisms about siloing hollow-stemmed plants, but I have none. The trouble, I think, has been in allowing these crops to become too mature, or letting them wilt too much after cutting. Cut all these crops in the prime of their succulence, get all the dew in the silo you can, and if any doubts remain, use water.

I am preparing to silo a crop of rye and hairy vetches in the spring. I have never grown vetches, but am going to try them, but fear my soil too heavy. I expect to seed my corn stubble to rye, 2 bushels per acre, using from 1½ to 2 bushels vetches and in the early spring sow clover. I am familiar with rye and know it must be siloed before it shows a head, and if the vetches have not made a paying growth. trust to getting a crop of clover and vetches later on.

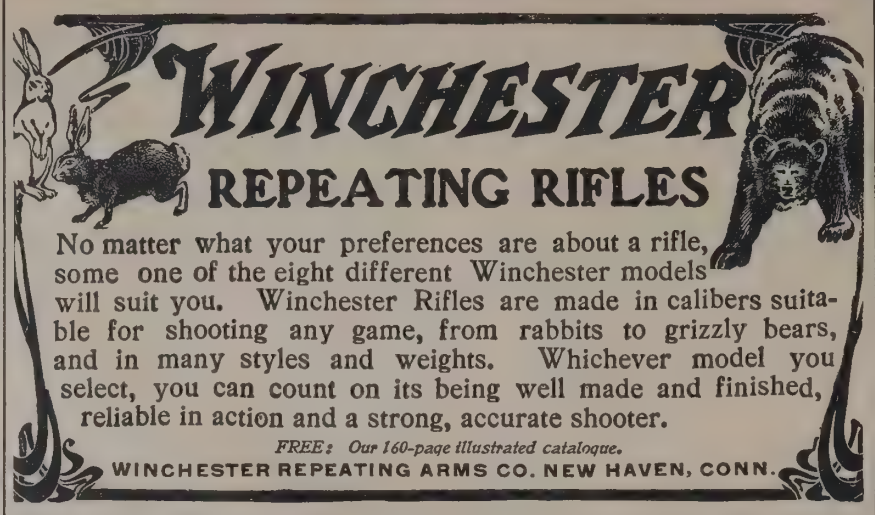
This will give me two cuttings in a year and leave the ground in good condition for corn. This is a two-year rotation of feeding crops, and, with the application of 30 loads fresh barn (not barnyard) manure per acre, we feel justified in expecting some returns, although I am applying 300 lbs. 14% acid phosphates per acre this fall.

My reason for these details are several:

First, the climate of the corn belt is genial to alfalfa.

Second, the home of the silo is upon the small farm, and the farmer who both superintends and does the work has many advantages over hired help, especially in utilizing the silo.

Third, the succesful siloing of small crops, and especially legumes without running through a cutter, is the cheapest way to make ensilage, and places the system within reach of even the smallest farmers.



Fourth, it gives a rapid rotation of feeding crops, and with a small alfalfa field, a balanced ration without a feed bill.

Fifth, it secures a supply of succulent feed before the dry summer begins, and enables the farmer to harvest and save his crops at their best without delay, giving place for the succeeding crop.

In connection with blue-grass pastures well cared for and intermixed with alfalfa the dairy farmer surely holds a controlling hand even though he lives in the non-glaciated hill district of Southern Ohio.

P. CLAWSON.

21 STRONG REASONS

WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to own a low-priced farm than to owe for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agricultural districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.

WISCONSIN BLUE GRASS LAND CO., Baldwin, Wis.

Cheap House Warming

The Modern House is warmed from a furnace. The very best furnace is the **LEADER Steel Furnace** We make it to fit your house and send it freight prepaid to your station. Any carpenter or handy man can set it up. Anybody can operate it. Burns hard or soft coal, wood or cobs. One furnace will heat the largest house in the coldest weather. Seven to eleven rooms heated with the fuel required by two stoves. If the weather is mild less fuel is used. Only one fire to take care of and that requires but a few minutes a day. No dust, smoke or ashes in the rooms. Even, delightful heat day or night in any kind of weather. Send to us for free estimate of the cost of fitting your house and ask us for our booklet telling all about these furnaces. We send estimates and information free. Buy of the makers and save the middleman's profits. Write for our catalogue No. 35.

HESS WARMING AND VENTILATING CO. CHICAGO

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

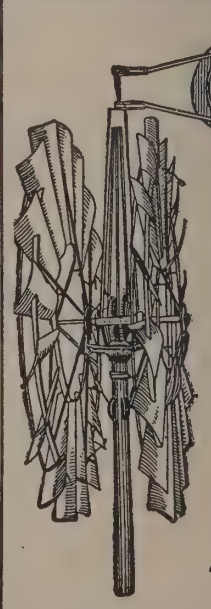
For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn, (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x2 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

Improved and Unimproved Farms for Sale



Farm No. 1 consists of 90 acres with frontage on a fine lake where there is excellent fishing and game. This lake is one of a chain of lakes on which you can travel for twenty-three miles. Has two-story house with eight rooms. Two-story log barn. Ice house and ten acres cleared. For sale at a bargain. One mile and a half from the railroad.

Farm No, 2. One-half mile from the railroad. 100 acres or more if desired, five acres cleared. Two-story, eight room house. Glass chicken house. First-class hog pen. Plenty of timber on land for own use, and quite a quantity of saw timber. We have besides this 16000 acres of unimproved land. Heavy black soil. All lies in Central Wisconsin. Low priced Excellent markets. Will grow any kind of crop and produce immense results. Excellent water supply. Splendid markets and a local demand for everything that is raised. None of the land lies more than three miles and a half from the railroad.

WISCONSIN FARMS

Will furnish names of people who have bought from us who have made big success. Can furnish lands in either small or large quantities. Can furnish reduced rates to see the lands. Easy terms to suit the convenience of the purchaser. As safe and desirable an investment as government bonds. Write in for maps and any information you may desire.

or other real estate, **no matter where it is or what it is worth.** Send description, state price, and learn my wonderfully successful plan. W. M. OSTRANDER, 250 North American Building, Philadelphia

"ADVERTISEMENT."

THE ROOT OF THE MATTER

He Cured Himself of Serious Stomach Trouble By Getting Down to First Principles

A man of large affairs in one of our prominent eastern cities by too close attention to business, too little exercise and too many club dinners, finally began to pay nature's tax, levied in the form of chronic stomach trouble; the failure of his digestion brought about a nervous irritability making it impossible to apply himself to his daily business and finally deranging the kidneys and heart.

In his own words he says: "I consulted one physician after another and each one seemed to understand my case, but all the same they each failed to bring about the return of my former digestion, appetite and vigor. For two years I went from pillar to post, from one sanitarium to another. I gave up smoking, I quit coffee and even renounced my daily glass or two of beer, but without any marked improvement.

"Friends had often advised me to try a well known proprietary medicine, Stuart's Dyspepsia Tablets and I had often perused the newspaper advertisements of the remedy but never took any stock in advertised medicines nor could believe a fifty-cent patent medicine would touch my case.

"To make a long story short I finally bought a couple of packages at the nearest drug store and took two or three tablets after each meal and occasionally a tablet between meals, when I felt any feeling of nausea or discomfort.

"I was surprised at the end of the first week to note a marked improvement in my appetite and general health and before the two packages were gone I was certain that Stuart's Dyspepsia Tablets were going to cure completely and they did not disappoint me. I can eat and sleep and enjoy my coffee and cigar and no one would suppose I had ever known the horrors of dyspepsia.

"Out of friendly curiosity I wrote to the proprietors of the remedy asking for information as to what the tablets contained and they replied that the principal ingredients were aseptic pepsin (government test), malt diastase and other natural digestives, which digest food regardless of the condition of the stomach."

The root of the matter is this, the digestive elements contained in Stuart's Dyspepsia Tablets will digest the food, give the over-worked stomach a chance to recuperate and the nerves and whole system receive the nourishment which can only come from food; stimulants and nerve tonics never give real strength, they give a fictitious strength, invariably followed by reaction. Every drop of blood, every nerve and tissue is manufactured from our daily food, and if you can insure its prompt action and complete digestion by the regular use of so good and wholesome a remedy as Stuart's Dyspepsia Tablets, you will have no need of nerve tonics and sanitariums.

Although Stuart's Dyspepsia Tablets have been in the market only a few years yet probably every druggist in the United States, Canada, and Great Britain now sells them and considers them the most popular and successful of any preparation for stomach trouble.

M. H. FAIRCHILD & BRO.....CHICAGO

Killing Quack Grass.

ED. HOARD'S DAIRYMAN:—The article in the DAIRYMAN of August 21st, on quack grass, will be read with interest in many localities, especially in the northwest, and more especially in Wisconsin, as the soil of a great portion of this state is such as to promote the rapid growth of quack. I shall not differ very much as to its treatment therein mentioned, but I will digress somewhat, and it may seem to be taking a round-about-way in so doing.

Weeds are the great pest of this country and the great hindrance to dairymen in the eastern states. Here in New York State, it was only a few years ago that the Canada thistle was thought to be the worst weed, but in later years other and more virulent species of weeds have been creeping in, until now the grasses are too often almost entirely crowded out.

This is why, no doubt, the settlers in the northwest from the eastern states, are so solicitous for legislation to prevent the spreading of weeds. The treatment for the killing of weeds is somewhat similar with all, but has to be more persistent with some than with others, which is the case with quack, and more so in Wisconsin and other portions of the west than in the eastern states, owing to the pliability of the soil in which it makes such rapid growth that the farmers have become alarmed, and I think not necessarily so at all, for if its habits are studied into and a proper treatment applied, they will soon get over their fears.

My brother, near Berlin, Wis., writes me he has some quack, and wants to know how I would treat it, and he says some there cover it with straw to smother it out. I wrote him to be sure and smother it to death, but recommended what Mr. Henry did, that is to plow as soon as the grain is off, and further to harrow every few days. the balance of the season, and do this for two seasons, and with the second crop sow clover to finish the choking process.

One thing I would differ with Mr. Henry in, is the late plowing. If the choking process has been persisted in the roots below are by this time forming humus, and better remain to assist the next crop, which can be relied on sure to be a good one if properly disked and harrowed in the spring.

There, I hope I have made the indiscretion that my adjoining townsmen, Mr. Henry Van Dreser, did—that is, he used a little plain, common sense as applied to agriculture, and particularly as to poultry management, and then his critics said he was seeking political notoriety. I think, however, he shares with me in the sentiment advanced by the great Fox of England, who said, that the agriculturist who could make two blades of grass or two stalks of grain grow where one now grows is of more account than all the politicians combined.

In conclusion, I wish to ask the farmers of the state of New York, if there is any doubt about their getting two blades of grass where they now get one, if their weeds were eradicated.

AUGUSTUS PARSONS.

Sharon Centre, N. Y.

A New York Dairy Record.

ED. HOARD'S DAIRYMAN:—After reading J. A. M.'s July record in the last DAIRYMAN, made me feel like submitting mine. I have eleven cows, or three that are six years or over old, four 4 years old, two 3 years old, two 2 years old. They gave 4,877 lbs. the last 16 days of June, 9,563 lbs. during July and 4,140 lbs. the first 14 days of August. The average price per hundred was $.85 at the cheese factory, where milk was sent.

My cows are half-blood Holsteins, raised by myself, and have been in milk between 5 and 6 months, with no grain since the middle of May, but as J. A. M. says "they simply eke out their own salvation in the pastures."

I like HOARD'S DAIRYMAN the best of any dairy paper I have taken.

Watering the Herds

WITH the fencing of the ranges has come the need for an artificial water supply upon the great stock farms of the West. That cattle may thrive and fatten for the market, it is absolutely essential that this supply be both *constant* and *abundant*. The picture shows a typical scene upon many of the largest ranches, where the **HOT AIR PUMP** is delivering its supply into the storage tank, whence it is drawn off daily as required, in any volume up to 100,000 gallons. No driving of the herds to some distant river is required, thus much expense is saved and the cattle drink quietly, as nature dictates, at an *ever ready* and *abundant* supply. Descriptive Catalogue B5 sent free on application.

Rider-Ericsson Engine Co.

Remember, the Hot Air Pump is Automatic, requires no skilled attention, and is the cheapest form of constant water supply now known.

HANCOCK DISC PLOWS

HAPGOOD

THE PLOW EVERYBODY IS TALKING ABOUT

Genuine **Hancock** Disc Sulky and Gang

Lightest Draft Plow in the World

Changes the Old Method of Plowing as the Twine Binder Did the Old Method of Harvesting.

We dare not tell you half the facts We want you to see it in the field. Sent on trial. Not one cent in advance. We guarantee to do fifty per cent more work with the same team and do it better than any other Disc or Mould-Board Plow on earth. Will plow hard, dry ground where no other plow will work. We furnish hundreds of letters from farmers that it will plow almost anything either wet or dry. We want you to see it in the field and will give liberal discount on the first plow and special inducement to help introduce it where we have no agents. We are exclusive manufacturers for two-thirds of the United States of the Genuine Hancock Disc Plow, the only plow branded or advertised as "Hancock." Beware of cheap imitations that look like our plow, but which lack the essential features (covered by our patents) that make the Hancock Disc Plow the wonder of the age and the Only Successful Disc Plow on Earth. "Imitation is the sincerest flattery," but do not be deceived by imitations. See that the name "HANCOCK" is on the plow. Write now and get ready for Fall Work. Circulars and hundreds of testimonials from prominent farmers furnished on application. We do not ask you to take our word for it.

$28 MADE ME $500

GRAFTON, MASSACHUSETTS.

International Stock Food Co., Minneapolis, Minn.

GENTLEMEN:—Enclosed find check for $28 as payment for **"International Stock Food"** shipment. Would say that the **"International Stock Food"** you shipped me improved my stock, both in looks and milk. I had an auction of forty head that brought me quite $4000. Am sure that **"International Stock Food"** should have the credit for at least $500 of this amount. Please send me another lot.

Yours truly, J. W. BEATTY.

☞We Have Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine and Unsolicited.☜

We own "International Stock Food Farm," which is located 12 miles from Minneapolis and contains 650 acres. We feed "International Stock Food" every day to all our WORLD CHAMPION STALLIONS, DAN PATCH 1:59 ¼ and DIRECTUM 2:05¼; to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. "INTERNATIONAL STOCK FOOD" ☞3 FEEDS FOR ONE CENT☜ is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human system. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these Medicines promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High-Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Fifty Thousand Dealers throughout the World. ☞Your Money will be Promptly Refunded in Any case of failure. It will make your Calves or Pigs grow Amazingly and has the largest sale in the World for keeping them healthy. ☞Beware of the many Cheap and Inferior Imitations. No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or a Falsifier.

SAVE THE WHOLE CORN CROP

A corn crop may be profitable without saving the fodder, but it will be twice as profitable if it is saved. The new method of handling corn saves the entire crop. The new way is to run all the corn through

JANNEY'S PATENTED HUSKING PIN — IT TAKES OFF THE SHUCK

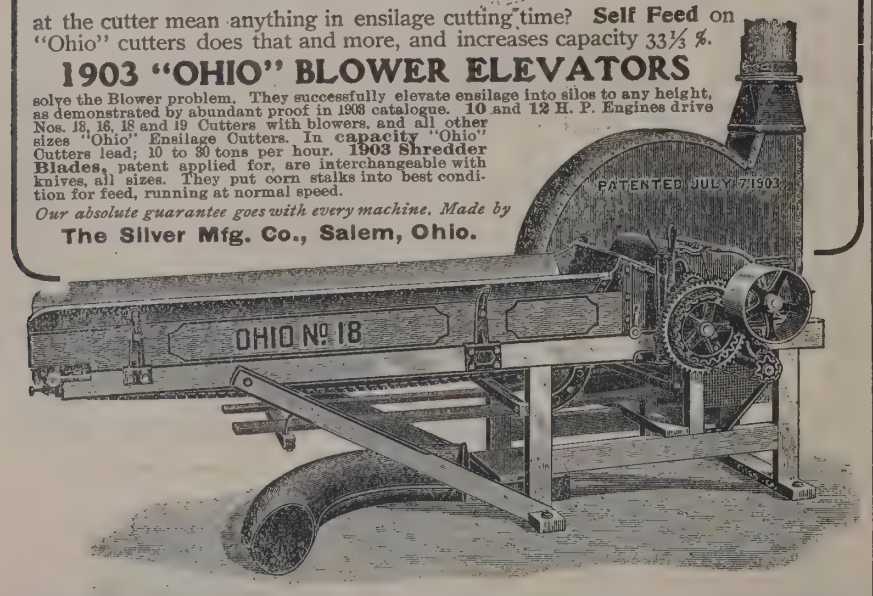
If you feed corn hay you can sell all your meadow hay. You can also bale and sell your surplus corn hay; big demand. You may add further to your profits by husking and shredding for your neighbors. Pays better than a threshing machine and costs less. Eight years in the field; more in operation than any other.

JANNEY COMMON SENSE CORN HUSKER and FODDER SHREDDER

Best made. It husks all the corn and shreds the fodder into "corn hay." Corn hay is the equal in feeding value of best timothy hay Ask your dealer or write us for Husker Catalog.

JANNEY MFG. CO.
OTTUMWA, IOWA
DEPT. D.

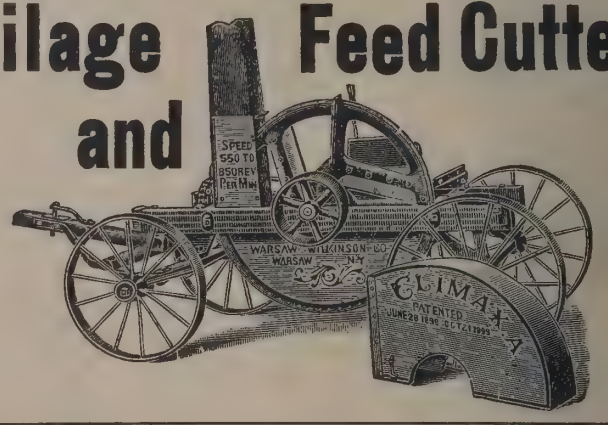
Does Saving ONE or TWO MEN



at the cutter mean anything in ensilage cutting time? **Self Feed** on "Ohio" cutters does that and more, and increases capacity 33⅓ %.

1903 "OHIO" BLOWER ELEVATORS

solve the Blower problem. They successfully elevate ensilage into silos to any height, as demonstrated by abundant proof in 1903 catalogue. 10 and 12 H. P. Engines drive Nos. 18, 16, 18 and 19 Cutters with blowers, and all other sizes "Ohio" Ensilage Cutters. In capacity "Ohio" Cutters lead; 10 to 30 tons per hour. **1903 Shredder Blades,** patent applied for, are interchangeable with knives, all sizes. They put corn stalks into best condition for feed, running at normal speed.



Our absolute guarantee goes with every machine. Made by

The Silver Mfg. Co., Salem, Ohio.

CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

4 HORSE SWEEP MILL and 2 Horse and Horse Power.

Grinds corn with shucks, rye, barley, wheat, oats and all other grains. Self feeders. Geared 7 to 1. Light draft. Great Capacity. (Also make plain sweep and Belt Mills; 10 sizes.)
N. P. D. Bowsher Co., South Bend, Ind.

CUTTERS and BLOWERS. "They Throw and Blow"

They require less power than any other blower because the wheel containing the knives also contains paddles which throw and fans which blow. A two-horse tread power will cut and elevate 4 tons of ensilage per hour, and a 10 h. p. engine 20 tons per hour. No chains, belts or cogs to slip and waste power. Also silos, horse powers, engines, carriers, saw machines, etc.

Time To Talk Tubular

Is there waste in your dairy? Lost Cream—inferior butter—sour milk—needless labor? It's time to think about making winter work easy. Winter days are short and cold! Spend more time by the fire—less time with pans, cans and trips to the creamery. It's time to talk

Tubular Cream Separators

Only the Tubular Separator has a SIMPLE TUBULAR BOWL suspended from a single ball bearing. No wabble, and no vibration. Others have unsteady bucket bowls set on top of long spindles. Only the Tubular bowl has a single tiny piece inside—and that removable—and it can be thoroughly washed in three minutes. Others have 4 to 60 hard to wash cones, discs, cylinders or other contraptions that hurt hands, churn cream, taint butter. Only the Tubular has enclosed, self oiling gears. Only the Tubular has a low supply can. Only the Tubular has a bottom feed—a feed making perfect separation sure and swift. "Only the Tubular Separator is modern" wise dairymen say.

Our fine free catalogue tells why Tubular Separators skim cleaner, run lighter, wear longer and are more in demand than any other. Write today for Catalog No. 144.

M. C. RANKIN & CO.,
Herman Bldg. Milwaukee, Wis.

The "Pioneer"

That's the name of a brand of parchment wrapping for the preservation of butter that goes before every other article manufactured for the purpose.

Pioneer Brand Parchment Paper

keeps the delicate flavors in and prevents butter from absorbing the foreign odors it meets in commission house, cellar and shop. Has no taste or smell to impart—pure vegetable parchment, tougher wet than dry.

Don't Mistake the Brand.

There are papers made in imitation. The *"Pioneer"* is the original wrapping which put the cotton or linen cloth out of business. It differs from so-called parchments in that it is a vegetable product instead of rags and paper. Sheets for print wrapping, box and tub lining. Name or brand on sheets when desired. Write for free samples and interesting book, "Better Butter."

Official Records of Holstein-Friesian Cows From July 31 to Sept. 2, 1903.

These records are made under the careful supervision of our agricultural experiment stations. The representatives of the stations weigh the milk and ascertain the amount of fat it contains, and the superintendent of Advanced Registry determines the equivalent butter on the basis of 85.7 per cent fat to the pound.

During this period, reports of twenty-two cows have been approved, all of which are seven day records.

Winana Beets DeKol 44887—6 years, 2 months, 4 days, commencing 7 days after calving: Milk 509.6 lbs., fat 16.566 lbs., equivalent butter 19 lbs. 5.2 oz. Owner, Henry Stevens & Son, Lacona, N. Y.

Myretta Royal Pietertje 47895—6 years. 1 month. 23 days, commencing 7 days after calving: Milk 441.2 lbs., fat 16.432 lbs., equivalent butter 19 lbs. 2.7 oz.

Preserving Corn Against Weevil.

Do you know of some method of preserving corn against weevil? Ricardo Jimenez.
San José, Costa Rica.

The method in common use is to put the corn in a tight wooden or other kind of box and put in a small amount of carbon bisulphide, the fumes of which are very poisonous to insect life. All lights must be kept away, as the liquid is very inflammable and the vapor explosive.

MELONEY'S Automatic Milk Cooler and Aerator TRADE MARK BESTOV

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56. Includes postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on lable is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office orExpress Order (never by personal check), addressing Hoard's Dairyman, Fort Atkinson, Wis.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

Entered at Fort Atkinson, Wisconsin, as second-class matter.

Bromus Inermis.

Press Bulletin.

Bromus inermis (awnless, smooth, or Hungarian Brome-grass) is a very hardy, perennial grass, with smooth upright stems from 18 inches to 3½ feet high, and with open panicles or seed heads 4 to 8 inches long. It has a very heavy system of roots and underground root-stalks, which after it is well established makes a very tough sod and gives it great drouth-resisting qualities. It is a native of Europe and Asia, and has been known for over a hundred years, but was not cultivated until a few years ago, because it was thought it would become a pest similar to quack grass if cultivated. During the last decade, it has come very rapidly into prominence in this country. It has been grown in most of the western and northwestern states and reports have been made by the North and South Dakotas, Nebraska, Colorado, Montana, Wyoming and Idaho Experiment Stations. These reports have been favorable to the grass. Because of its great drouth-resisting qualities, Bromus inermis is especially adapted to the drier portions of the State and will grow in places where none of the other tame grasses will survive. It is also well adapted to practically every other portion of the State, as it is able to thrive under wet conditions as well as dry. It also makes a good growth in shady places, where most other grasses will not do well. It will produce most abundantly on rich, heavy soils, but will grow on poor, thin soil better than most of our other grasses.

BROMUS INERMIS FOR PASTURE.

Bromus inermis makes an excellent pasture grass as it shoots up in the spring about two weeks earlier than any of the native grasses, produces a good aftermath or second growth, and continues to grow especially late in the fall. If the summer is dry it will stop growing, and start again after the beginning of the fall rains, but if the dry period is not too long it will continue to grow from early in the spring until late in the fall. At the Kansas station we have grown Bromus inermis in a field way for four seasons. This summer we have pastured some young stock, ranging from 9 to 18 months of age, on a field of Bromus inermis seeded last fall. These calves have not shown any noticeable preference between Kentucky blue-grass, prairie-grass, and Bromus inermis, and have thrived well on the Bromus. The grass stands trampling by stock exceedingly well. It is so vigorous that it will run out all weeds and other grasses, after it once becomes well established. It, however, may be sown with other grasses and legumes, and allowed to take full possession in a few years.

BROMUS INERMIS FOR HAY.

Bromus inermis will also make a very satisfactory crop of hay, yielding from 1½ to 4 tons per acre, according to the season and the richness of the soil. It may usually be cut twice during the season. The first crop is sometimes cut for seed by a self binder, raising the cutter bar as high as possible and cutting off the heads and then following in the same swath with the mower to cut the hay. The bundles may be left upon the swaths of hay until the hay is raked, when they may be shocked up between the windrows, thus carrying on the processes of haying and harvesting in the same field at the same time. The yield of seed varies from 200 to 400 pounds per acre. It should be cut for hay just after the bloom falls. The hay is relished by all kinds of stock, and its feeding value is fully equal to that of timothy or prairie hay.

PREPARATION OF SEED-BED.

It is quite essential to prepare a proper seed-bed. In order to conserve the moisture and sprout the seeds, the soil should be well firmed. The ground should be plowed some time before seeding, so as to become thoroughly firmed and settled by the rains, or if it is impracticable to do this a subsurface packer or similar implement should be used to follow the plow and pack the soil. The ground should be harrowed at frequent intervals until seeding time, and special pains taken to prepare a thoroughly pulverized seed-bed near the surface. If the ground is not too hard and is comparatively free from weed seeds, an excellent seed-bed may be prepared with a disk harrow and other surface-working implements. This method insures a firm subsurface, the importance of which has just been mentioned.

SEEDING.

Bromus inermis should preferably be sown in the spring, and as early as it is possible to prepare a suitable seed bed, thus insuring plenty of moisture to start the young plants and keep them growing until they have sufficiently developed root systems to enable them to survive the dry periods we are apt to have later in the season. If sown in the spring the ground should be plowed in the autumn, if thought best to plow at all. Bromus inermis may also be seeded in the fall; and if the season is favorable as good a catch may be obtained as in the spring. If sown in the fall, sow from the first to the middle of September. It is not advisable to sow Bromus inermis with a nurse crop except in localities where the soil drifts badly by the winds. This grass will hold the soil from drifting after it has a few weeks' growth. The best apparatus of which I know for seeding Bromus inermis is a wheel-barrow, broad-cast seeder, with a hopper made especially for sowing this seed. This should be followed by an ordinary smoothing harrow. It may be seeded by hand by a man experienced in this method of seeding. The ordinary grain drills have not proved satisfactory generally, as it is very difficult to get the seed to pass through the seed cups of the drill. Sow 18 to 20 pounds of seed per acre. Seed may be secured of any of the reliable seed houses of the west. The price varies from $10 to $15 per hundred pounds, according to the grade of seed and the firm with which you deal. It pays well to get a good grade of seed. If you cannot afford to purchase sufficient seed for a large area, get a small amount of seed of a good grade, sow it on a carefully prepared seed bed, and raise your own seed with which to sow a larger area.

RENEWING THE CROP.

After the third year the roots and underground root-stalks develop such a dense mat that there is neither room nor nourishment for them to continue their growth, and the field becomes sod-bound, the production being materially decreased. Several remedies are recommended: one is to disk thoroughly with the disk harrow; another to plow and then thoroughly firm the sod with a subsurface packer or heavy roller. Where re-seeding is not too difficult, and where the land can profitably be used for the growing of other crops, the most practical method of renewing the grass is by re-seeding.

KILLING THE SOD.

Bromus inermis cannot be considered a pest notwithstanding its hardiness. No experiments in destroying the grass have been conducted at this station, but the trials of other stations have demonstrated that it can be successfully killed out by breaking, after the removal of the hay crop, disking at intervals, and back-setting in the fall. Dairying in Prince Edward Island.

Ed. Hoard's Dairyman:—This is a great year for dairying in this Province of Canada. We believe it is the best year for cheese in this Island province for three years. Three years ago the top notch was reached in the output of the Island factories. Since then the annual output has receded until last year the output was smaller than six years ago. This certainly was a bad state of affairs. True the dry weather of last year and the year before had considerable to do with the diminution of the cheese industry, but this could not be all. Patrons withdrew from the factories believing they were not making enough of money. If it were confined to the small patrons only this would not matter so very much, but very many of the larger patrons withdrew in the last three years, so that the final output at the end of the year was reducing at a serious pace.

This season apparently many of the old patrons are back again, or those who stuck right along are sending more milk, or probably there are considerable new patrons. Whatever way it may be the industry never was in a more healthy condition. The milk flow is greatly exceeding last year and what is more, the flow of milk is being kept up to a respectable average right along. We believe the output of cheese for the season of 1903 will equal that of any year since the business was begun.

Some few years ago a good many became over-enthusiastic over the cheese factory. They fed everything to the cows to make milk. They turned their cows into their hay land, asserting that a ton of hay growing in the field would produce a ton of milk, and as hay was worth only about $8.00 and milk $15 per ton, the advisability of turning their hay into milk was apparent. But these expectations were not always realized. A hundred pounds of good pasture grass in hay will make a hundred pounds of milk, but it must be remembered that it will take 600 to 700 pounds of grass to make a 100 pounds cured hay, to make a 100 pounds of milk, which, perhaps was not the way many of those people looked at it. A great many of the more opulent farmers, who grew lots of grain, began blindly to feed this grain to the cows. They began feeding this grain in early spring when the cows were non-producing, that is before they had calved, thinking that the cows would repay this luxurious feeding on the double after calving. They naturally would not do this. Others retained the few hundred bushels of grain they usually sold in the spring at good prices for seed purposes, to feed to the cows when the cheese factory started, expecting that they would double the market value of their grain. In this, they were doomed to disappointment. They finally got disgusted with "throwing away their grain" as it were, and stopped feeding grain at all, and also stopped the practice of turning the cows into the hay fields. This brought the patron back to the primitive days when the cows might forage for themselves any old way. Some continued sending a small amount of milk, while others dropped off, deciding that dairying did not pay.

These are some of the causes of the cheese industry going down in this province in the last three years.

You see, the patron did not have the right kind of cow to turn a hundred pounds of hay grass into a hundred pounds of milk; or to turn prime seed oats into milk. What is more, the patron was a tyro among cows. His wife and hired girl usually looked to the cows during the milking season. Not being money makers he took no interest in them, so long as he had butter to use at meal times and cream for his tea. That is all he ever expected of the cows. The change was therefore too great for the average man.

As time goes on the patron is learning a few things, and this year, it appears, he knows considerable, if we judge by the healthy tone of the cheese business this season.

We believe there is considerable to be learned yet, and for this reason nothing phenomenal can be expected of P. E. I. dairying for a few years yet.

Dairying is one of the most difficult branches of farming in the catalogue, and in the course of events, it is only one here and there that will make a success of the business. If it were an easy business there would be no incentive for brainy men to go into it.

On most farms there is little grain in the summer months to feed, and the great majority of farmers consider it heterodox to purchase feed of any kind, and hence the cows, and other animals on the farm for that matter, must go without all summer. "It never pays to buy feed for an animal," says the farmer on every side. What value do you set on the feed you grow yourself, pray? Why does the farmer set no apparent value on the bushel of grain in his granary, of his own growing, while the bushel purchased has an exhorbitant value? This is strange, but it is just the way.

Another thing with the patron is, that if a cow is in pretty good pasture she is doing all right, though the cow does not fill herself completely. They do not appreciate the need of filling the cow completely, if a respectable milk flow is expected. There is too much of average work. "I am feeding pretty well;" "My cows are in pretty fair pasture, and ought to be doing better than they are." This is the average man who gets average results. He is not enthusiastic. There are so many like this. J. A. M.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

SIGN NAME, POST OFFICE AND STATE.

Hoard's Dairyman is in constant receipt of letters containing money, in which the writers omit to give their names, or post office, or state and some times none of these are given. We have repeatedly spoken of these things and advised every farmer to go to his local printer and have say a hundred letter sheets struck off, with a little card in the left hand corner like this:

John Doe,
Ft. Atkinson, Wis.

Then if he will have the envelope printed with the same card he will be doubly sure that he never will write a letter in which the receiver will not be sure to know where it comes from and who the sender was. Thousands of dollars are lost every year because of a lack of just this simple provision against carelessness.

THE CENTRIFUGAL FORCE OF A SEPARATOR.

At a speed of 6,000 to 7,000 revolutions per minute the tensile strain on a separator bowl is sixteen tons per square inch says Prof. Dean of Canada. This is a tremendous force, yet it is necessary in order to force the butter fat out of the milk serum. It also cleans the cream from dirt. Deep setting or shallow setting simply keeps the dirt soaking in the milk for 24 to 36 hours.

CLOVER HAY.

C. Kasper writes to the *Modern Farmer*, and the article is approvingly copied by the *Dairy and Creamery*, that clover "cannot be excelled by any other hay as feed, except cow pea hay when it contains the seed." There is a good deal of such careless writing and copying going the rounds of the agricultural press, especially where a considerable portion of the editing is done with the shears.

While it is true that clover, cut at the right time and properly cured, is a valuable hay, it is also true that cow pea is not the only hay plant that exceeds it in feeding value. Alfalfa is nearly a third richer in protein, which is the great ruling element to give such feeds the value. Clover analyzes 8.6 in protein, while alfalfa analyzes 11 per cent, only 1 per cent below bran.

A TRUE STATEMENT.

On page 727 of this issue, our Prince Edward Island correspondent utters a very true statement. He is describing the ups and downs of dairy farming in that most beautiful and fertile island, all owing to the fact that the minds of the farmers were not as well equipped in dairy knowledge as they should have been and says:

"Dairying is one of the most difficult branches of farming in the catalogue, and in the course of events it is only one here and there that will make a success of the business. If it were an easy business, there would be no incentive for brainy men to go into it."

All that is true, but it is not all of the truth. Not only is it a difficult business, but a large proportion of men engaged in it really work to make it more difficult by refusing to make a study of it. They refuse to believe that it is necessary for them to cultivate their minds and understanding and fertilize their brains, as all brainy men have been obliged to do, that succeeded in it.

LOVE THE GREAT SOLVENT.

To every mood or condition of the human mind is given certain specific perceptions. To see—see the truth concerning the things—is the first great necessity in doing things. "Love hath its own wisdom, and so has hate," said an ancient writer. And so we see, or do not see, in proportion as we love. This principle discloses the reason why some men succeed in the manipulation of the forces of nature, where others fail. To him who loves his work, shall special wisdom come concerning that work. Love opens the eyes; hate or dislike shuts them. Some men succeed wonderfully with men, others with animal life, others with certain forms of plant life, and others with machinery.

In each case we will find that they like men, like animals, like plants, or machinery. There is good sense then in the broad generic statement that stands as our caption—"Love is the Great Solvent."

What can we make of this principle in the promotion of our happiness and profit as dairymen? First, let us learn to love the cow; learn to love the methods of peace and gentleness that unlock the secrets of her nature. We should idealize our work; refine our thought concerning it. Then we will never weary of it. It will never become drudgery. Constant unfolding of new truth concerning it will come to us. What wonderful contrast is presented in this in the life of him who loves and him who hates.

PASTEURIZED WATER FOR BUTTERMAKING.

The water supply is one of those things concerning which too much is taken for granted in regard to its purity. A hole is dug or driven into the ground and the water that is pumped from it is assumed to be pure and clean, principally because no one is made sick by drinking it.

Water from a creamery well may be pure when the well was first dug, but the chances are, that at the end of a few years it is anything but clean. The soil of the average creamery is full of rotting material and every year carries the rotting material lower and lessens the power of the soil to dispose of fresh material. Once a water vein is reached the well is quickly, and seriously contaminated, although the water may be normal to taste and smell.

Such water may not cause sickness, but it will cause poor keeping butter, and thus is a direct cause of loss of money. The influence of wash water on the keeping quality of butter is shown in a recent bulletin issued by the Iowa Experiment Station. The conclusions are as follows:

(1) Water contains germs which cause butter to deteriorate in quality.

(2) These germs can be removed or destroyed in a practical and inexpensive way by two processes, viz.: Pasteurization and filtration.

(3) Butter washed in pasteurized wash water will keep normal much longer than the same butter washed in unpasteurized water.

(4) Butter made from pasteurized cream and washed in pasteurized water retains its normal flavor about twice as long as butter made with unpasteurized water.

(5) Unwashed butter made from good and well ripened cream keeps as well and in some instances better than the same butter when washed in unpasteurized water.

(6) Salt improves the keeping quality of butter.

(7) It pays to pasteurize the wash water as well as the cream. The cost of pasteurization of milk and water after pasteurizer has been purchased, is about .1 of a cent per pound of butter.

SHARP CONTRASTS.

We doubt if there is a business carried on in the country in which occur sharper contrasts in the ability, mental hunger, enterprise, and finally the yearly profits, than is found among the farmers of the United States who call themselves dairymen.

A leading manufacturer of Wisconsin, who is also an enthusiastic dairy farmer, after reading some of the Cow Census reports in the Dairyman where was shown men living side by side, where one man would make $1.50 to $2.00 for every dollar he spent on feed and the other lose 30 to 40 cents, said to us: "When I read these reports I am simply amazed that such farmers can live, or I might say, barely exist. Here they are in the full blaze of the 20th century with all the knowledge that is shining on this business of dairying and they are as unconscious of it as if they had lived a hundred years ago."

The difference between these two classes of dairy farmers is simply a mental one. The successful ones read and think, and improve in their business; the others go along day after day and year after year with no mental hunger, no desire for better knowledge, and consequently with no idea that what ails their pocket book is their own lack of dairy intelligence. If a man is really brainy and intelligent he will hunger after knowledge. There is no variation from this rule. Here is one out of many thousand of these contrasts. Mr. Adam Keir of Trunket, Pa. writes us as follows:

"I feel as if I cannot be without the Dairyman. I need just such mental food. I have done what I could to get others to give it a trial but only a few would do so.

There is a great need of such a paper in this community. Thanks for the Dairyman; every paper brings new and valuable ideas."

THE COW QUESTION IN PENNSYLVANIA.

The following letter from Dr. Joseph Bringhurst of West Chester, Pa., touches a question—that of raising good cows—that dairy farmers in the East, as well as the West, should seriously consider:

Ed. Hoard's Dairyman:—The coming question in Chester Co. among most farmers—and nearly all farmers here are dairymen—is, where to get cows. The majority buy fresh cows from dealers at public sales, that are brought from other counties of the state, or New York. The prices vary from $40 to $75. At one sale I attended, 12 cows out of 30 brought $60. It seems to me that to buy cows at these prices and have possibly one out of three turn out good and have to dispose of the other two after a time to the butcher or bologna man, is pretty expensive business.

On the other hand, a great majority of our farmers, many of them bright, well educated men, say it does not pay them to raise calves with milk averaging 3½ cents per quart the year round.

Cows are scarce here at any price. A reliable dealer told me yesterday that he paid $65 each for two cows in Franklin Co., Pa., to bring on here and sell again. He said if it continued so hard to buy cows out there as it now is, that he would have to stop business for a time as there was no profit."

The above statement is but a repetition of similar statements that have come to us from various portions of the United States.

The fact is that the enormous increase in the consumption of milk in the cities and towns of the country, is creating a great demand for cows, aside from what the butter and cheese interests create. The prices Dr. Binghurst gives are often paid in the great milk producing districts that supply Chicago and other western cities. It is true that there is a great demand for pronounced dairy cows, and this demand will continue even if financial reverses come over the country.

In the light of this demand we reason as follows:

These farmers who are bent on raising steers had much better raise good, well bred heifers. At two years of age and nearly ready to calve, heifers will bring as much or more than steers, and the cost of keeping will be less.

We hear much about raising steers for market. Why not raise heifers for the cow market?

To do this rightly, a few things are necessary:

(1) The use of fresh, sweet skim milk.

(2) A little good calf raising gumption; a little study and attention to the fact that these calves are babies and as such must be kept clean, healthy and growing.

(3) Under no circumstances to allow the calf to be checked in its early growth, up to one year of age, if it can be helped. The first year makes all the difference in the world, in the after appearance of the cow.

(4) See to it that the heifer is the product of a good registered bull of one of the four dairy breeds of cattle. Her main value will be based on the likelihood of her having lots of cow in her. To insure that, give her a father that carries an abundance of such blood and quality in his veins. In picking up such heifer calves from outside farmers, do not be afraid of paying a little more for those that are sired by such bulls. Such parentage will tell in the future quality of the heifer as a cow, and so she is worth more to raise for that purpose.

(5) Don't be afraid of the future of the dairy business. Don't be afraid to invest in a good bull, and all the necessary expense in the way of good, clean, warm quarters to raise calves in, as they should be raised.

(6) Try by all means within reach to have the cows calve in September and and October, so that the calf can have the advantage of 8 months of its early life without the torment of flies. This will make a great difference in its thrifty appearance.

(7) Then when you have a likely bunch of calves, yearlings, or cows for sale, advertise them where other dairymen who want to purchase such stock, can see it. This is simply good business sense.

THE WISCONSIN STATE FAIR.

It is somewhat of a question as to what extent horse racing, side shows, automobile racing and fakirs of various kinds can be introduced and the fair still be called agricultural. But if all these are a necessary part of an agricultural fair, if they together with the usual horses, dairy stock, agricultural machinery, etc., are a necessary part of the methods used for the amusement and instruction of farmers and their families, then the Wisconsin State Fair at Milwaukee, last week was a success. The side shows, from the snake eaters, up or down as they may be graded, do not require mention here, they always do their own advertising, and the methods they employ are as much a nuisance as the shows themselves, and we

were glad to see that their patronage seemed to be limited. The fair was handicapped by a heavy rain on Wednesday, which made a large part of the grounds a sea of mud. This was especially so in the section where the agricultural machinery was located, and in consequence there were few or no visitors brave enough to wade the mud for purposes of inspection. This was much to be regretted as the exhibition in this department was much larger than ever before, and agricultural machinery is something more in these days than a collection of plows and harrows. Much of the machinery was geared up and run by steam power and made an interesting illustration of the application of invention in assisting the farm work.

The horse, sheep, swine and fat stock departments were well filled, but in the dairy division there was a decided lack of exhibitors, especially from Wisconsin. In fact, if it were not for the entries of breeders from outside of the state, some parts of the dairy division would have been conspicuous by absence.

There was a Brown Swiss herd from Wis., exhibited by Inman Bros., Holsteins by W. B. Barney of Iowa, Guernseys by M. D. Cunningham, Kansasville, Wis., and Jerseys by E. A. Smith of Ill. There was an exceptionally good exhibition of Ayrshires by Sam Jones of Juneau, Ed. Finn, of Whitewater, and Adam Lietz of Waukesha.

The dairy cattle made but a thin showing for a Wisconsin State Fair, especially when we consider that Wisconsin is the second dairy state in the country, and still more so when we consider that within fifty miles of Milwaukee are some of the finest Holstein, Guernsey and Jersey herds in the country.

The Wisconsin Dairy School had a large exhibition of material pertinent to the teaching of dairying and creamery practice. To the average city visitor, at least, dairy machinery and creamery appliances are somewhat strange objects, and there was much inquiry as to the use of the separators, Babcock testers, butter workers and other things of that nature.

With the intention of exhibiting the methods of separating milk, ripening cream and churning, Prof. Farrington had made arrangements for a daily supply of milk, but his plans were changed by the eagerness with which the visitors, city and otherwise, demanded milk to drink, and the supply of material for the churn was very small in consequence.

The butter exhibit included 100 entries from four states. As might be expected, Wisconsin was largely ahead in numbers. Creamery butter scored from 98½ to 87. The total score is given elsewhere. Prof. McKay of Iowa, spoke highly of the even quality of the creamery butter, and stated that the highest scoring dairy butter, 97½, was the highest he had ever seen in this class. There was a much smaller exhibit of cheese, but of excellent quality. One of the most interesting small exhibits was a graphic illustration of the composition of milk, butter and cheese, in which each constituent was shown in its proper percentage in glass tubes; each tube containing either water, fat, casein or milk sugar in proper amount to show percentage composition.

This display was both attractive and educational and indicated well the modern methods that are being used to educate the dairy student into something more than a rule of thumb idea of dairy practice.

The fair was badly handicapped by the weather, but it was equally set back by its own want of conveniences. A fine grand stand and cement walk to the same are good things, but there is a much greater need for proper walks, drainage and exhibition buildings and unless these are supplied the Wisconsin fair will soon consist of a grand stand and race track and the agricultural part of its name will be completely, as it is now, partially a misnomer. Following is the list of prize winners in the dairy classes:

HOLSTEIN.

Bull, 3 years old and over—First, Jewell of Home Farm, W. B. Barney & Co., Hampton, Ia.; second, Colantha IV's Lad, W. B. Barney.

Bull, 2 years old and under 3—First. Sir Pietertje Posch, A. N. McGeoch, Milwaukee.

Bull, 1 year old and under 2—First, Aggie Colantha Lad, W. B. Barney & Co.; second, Sir Josephine Mechthilde Pietertje, Rust Bros., West Allis.

Bull calf—First, Prince of Home Farm, W. B. Barney; second, Lad of Home Farm, W. B. Barney; third, Prince Piebe Akrummer, Rust Bros.

Bull, under 2 years—First, E. A. Smith,

Heifer, under 2 years—First, E. A. Smith.

Dirt in the Dairy.

Experiments at the Illinois Station to compare the amount of dirt falling from washed and unwashed udders during the process of milking, are reported as follows. It was determined after several trials, with three different milkers on 30 cows, that it requires an average of 4½ minutes to milk a cow.

A glazed dish 11 inches in diameter, the size of an ordinary milk pail, was placed in the top of a pail and held under a cow's udder in the same position as when milking. For 4½ minutes the milker then went through motions similar to those in milking, but without drawing any milk.

The amount of dirt which fell into the dish during the operation was, of course, approximately the same as would have gone into the milk during the milking process. The dirt caught in the dish was then brushed into a small glass weighing tube, the udder washed, and the process repeated.

The dirt which fell from the washed udder was carefully brushed into a weighing tube. Both tubes were then placed in a dessicator, and after drying 24 hours were accurately weighed on a chemical balance. Sixty trials were made at different seasons of the year.

With udders that were apparently clean it was found that an average of 3½ times as much dirt fell from the unwashed udders as from the same udders after they were washed. With soiled udders the average was 22, and with muddy udders the average was 94 times as much dirt from the unwashed udders as from the same udders after washing.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

A Wisconsin Ration.

Please suggest a balanced ration to feed with hay (clover and timothy) also cut corn stalks and mangel wurtzels and if we get ready, with some silage too. I can buy malt sprouts for $12.00 per ton; bran about $15.00 by car lot, oil meal for $30.00 per ton, oats for about 30 cts. per bushel, corn and rye for about 50 cts. per bushel. Last winter we gave our cows only warm water with oil meal and oatmeal steamed, and they did well but it makes lots of trouble. H. L. W.
Mayville, Wis.

If these cows are fresh or soon to be fresh they will require more feed through the winter than cows that freshened last spring, just as a horse at hard work every day needs more feed than when idle much of the time and never called upon for constant work. A cow giving 20 to 30 lbs. of rich milk every day, is really hard at work and requires more feed than when giving only about half as much. The size of the cow also makes some difference in the amount of feed required. The best we can do is to suggest a basic or average ration and let the feeder add to or take from the amounts as circumstances may seem to require.

Ordinarily the following would be a fair average daily allowance for a mixed herd of cows.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover and timothy hay.....	8.53	.48	3.96	.16
10 lbs. corn stover (stalks)	5.96	.17	3.24	.07
20 lbs. mangels.....	1.82	.22	1.08	.02
4 lbs. malt sprouts..	3.59	.74	1.48	.07
4 lbs. bran.....	3.52	.50	1.52	.12
Totals.....	23.42	2.11	11.28	.44

With 30 lbs. of silage omit the stover and mangels.

Jersey or Guernsey?

I have high grade Jerseys; sell cream to creamery; most of my cows are rather small. Would you advise using a Guernsey bull, or of getting as strong a Jersey as possible. Most of the chances to sell cows here are to buyers that sell to the milkmen, so Jerseys are not wanted very much.
Plainfield, Mass. F. M. R.

The Guernsey and Jersey breeds are so similar in most respects, that a cross of them is not considered particularly objectionable with grade cows. Much more important than the question of which breed the bull represents, is the question as to the quality his breeding represents. Make more inquiry as to the dairy capacity of his dam aud granddams, than as to his size or anything else.

What to Feed With Oat Hay and Corn Silage.

Will you please tell me what to feed with my oat hay and corn ensilage this next winter?
We will commence cutting the corn next week, and a fine crop, well eared and past the roasting-ear stage now. Bran is $23 per ton, shorts $23. oil meal, $29. Oats were cut when in the milk and cured good. E. J. R.
Bethel, Wash.

Oil meal is relatively cheaper than the middlings and the middlings cheaper at the prices named than bran, but one can not well depend exclusively upon the oil meal and middlings,—although in combination they might be fed with the silage. We should prefer, however, to use some bran, and as an average for fresh cows would suggest trying, say, 2 lbs. oil meal, 3 lbs. middlings and 3 lbs. bran as the average daily allowance.

A Side Issue in Dairying, or Vice Versa.

ED. HOARD'S DAIRYMAN: — Among the notable things brought out in these replies from patrons of Skowhegan Creamery, is the area and number of trees in the orchards on their farms. Of course, all trees do not bear standard fruit, and all those supposed to bear good fruit do not come up to expectations. A number of patrons report no orchard. This is mainly from the fact that although the section is generally a good one for apples there are localities where apple trees can not live. We know some of these lands almost within a stone's throw of good productive orchards. But of those who live on orchard land it seems as though few have appreciated the value of a good orchard as an income producer.

Instead of one to three acres, why not ten to thirty in orchard? Some 300, 350 and 400 tree orchards are promising, if all are good varieties of fruit; but the 1,200 to 1,400 tree orchards, if of good winter fruit, must come, in their maturity, to eclipse all other departments of the farm on which they live, in value of products. They, of course, need care and attention, which costs something, but a few good crops from them sends the balance sheet up for large credits to orchards. This will be true if the trees are fed and fungi and insects are kept from doing harm to the foliage and fruit. Uncared for, an orchard is an eyesore, and is also dangerous to other orchards in the neighborhood. Lone trees of poor fruit on roadsides and in pastures should be destroyed to prevent the harboring of injurious crops of both fungi and insects on these uncared for trees. Thus every neighbor becomes in some measure responsible to all others in this, the same as in the proper precautions to kill out the warble flies by preventive means, and the destruction of troublesome roadside weeds.

We conceive that the small orchards were planted for family use only, when each farm was supposed to be a sort of independent little republic, and every man had a right to do what he pleased with his own. Now, on the interdependent system, which is so rapidly being worked out, a division of labor is compelled. Articles once produced on the farm, must now be purchased. The farmer, as a producer, must bring more of the fewer products of the farm to market to exchange for more things he needs to use. There is need of more labor, and he feels he is unable to pay the price required to bring him willing but unskilled labor. What shall be done?

Almost every young man and woman are up and off to the town, factory, or city, where hours of labor are more reasonable than on the farm, and the pay prompt and wages higher. It does not prevent the going, to warn them that temptations to spend money are numerous, and only the strongest keep out of contamination with vice. A counterpoise ought to be applied. You have in the grange and free rural delivery of mail two very able helps. Why not think out a plan to put able and willing hands on your farm and train them to become skilled? Why could not a good tenement house be put on the farm; a garden and yards for chickens and pigs with suitable shelters be supplied?

Then affix a reasonable rental for five or ten years. Put the larger rent on the first and less on each succeeding year, or better fix it so the rent pays for it in a series of years. Have wages of tenant fixed as well as what shall be paid to any other members of his family. Let wages be on an up grade, gradual at first, until a standard for expert work is reached.

Some plan of this kind would enable

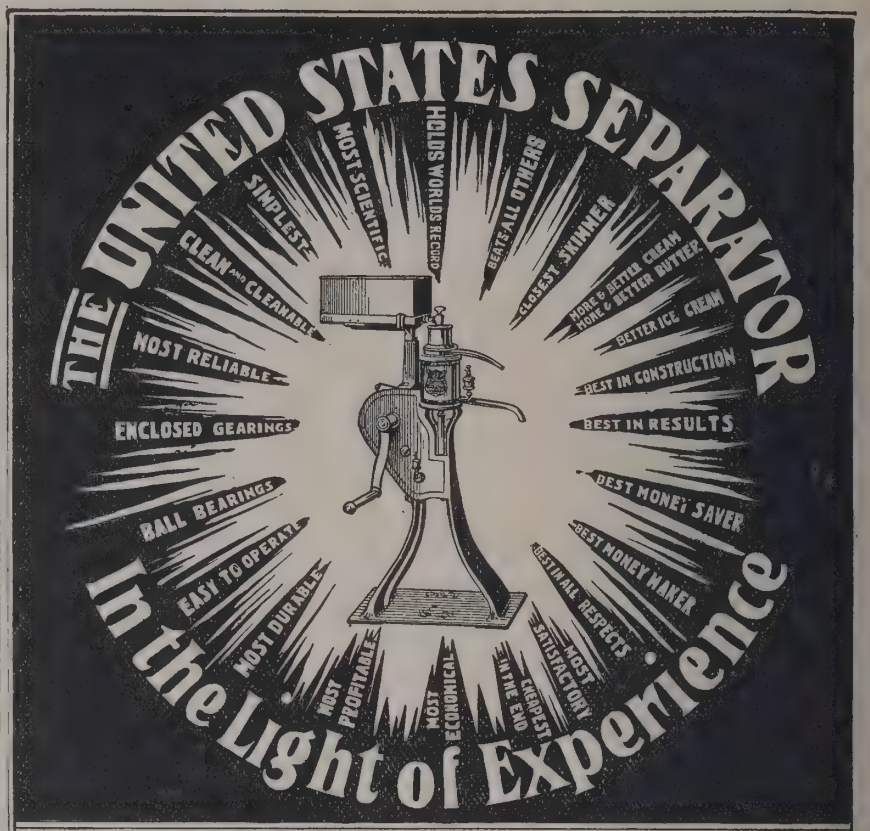
CUBS' FOOD.

They Thrive on Grape-Nuts.

Healthy babies don't cry and the well nourished baby that is fed on Grape-Nuts is never a crying baby. Many babies who cannot take any other food relish the perfect food Grape-Nuts and get well.



"My little baby was given up by three doctors who said that the condensed milk on which I had fed it had ruined the child's stomach. One of the doctors told me that the only thing to do would be to try Grape-Nuts, so I got some and prepared it as follows: I soaked 1½ teaspoonfuls in one pint of cold water for half an hour, then I strained off the liquid and mixed 12 teaspoonfuls of this strained Grape-Nuts juice with six teaspoonfuls of rich milk, put in a pinch of salt and a little sugar, warmed it and gave it to baby every two hours.

In this simple, easy way I saved baby's life and have built her up to a strong healthy child, rosy and laughing. The food must certainly be perfect to have such a wonderful effect as this. I can truthfully say I think it is the best food in the world to raise delicate babies on and is also a delicious, healthful food for grown-ups as we have discovered in our family." Name given by Portum Co., Battle Creek, Mich.

Grape-Nuts is equally valuable to the strong, healthy man or woman.

Grape-Nuts food stands for the true theory of health.

many a farmer to enlarge his business by planting trees and to cultivate better and at the same time keep more cows. He need not be tied so closely to the farm, and should thus be able to secure a larger income than before he shared his work with his neighbor.

Some young man would be sure to see his opportunity with an opening of this kind with a good farmer and settle down to steady life rather than go off to the city. This is suggested with the hope that some one will take it up. Houses are purchased in the cities on a plan of this kind and it will doubtless work well in the country if given a fair trial.

Reference was made to the fact that at least one of these patrons has been in the State University Dairy School and another has had a year's training in an Agricultural College. Such cases to be noted thus are far too few. Many other young men should take such a course of study that they may understand their business and be able to take advantage of opportunities to improve that they are not likely to see without the special information to be obtained in that way.

There is a growing demand for such workers. Recently we have met people in the middle West looking for such helpers on farms and have the same voiced from the extreme South, in a recent correspondence, where there is also a need for just this kind of labor. Many a boy is going out from the vicinity of this creamery who, if he had the special training to test the cows and find that he can make a difference of more than city wages will net, to stay on the old farm and apply special efforts to improved methods to change crops, and reduce labor in spots where it has been hardest, would find his greatest pleasure in such work. Once he gets started in the spirit of such an effort to see what can be developed he would be inspired to continue it. FRANK E. EMERY.

Chicago.

Essentials In Cream Testing.

Professor Eckles, discussing the subject of cream testing before the Missouri Dairymen's Association, said: "The increasing use of the farm separator has brought a new problem to many in regard to cream testing. I believe this is the most difficult problem in testing that the creamery manager has on hand today, and of course the patron is just as much concerned, and even more.

" To get a fair, accurate sample of cream under all conditions and to make a correct test of that sample, I assure you is no job for a careless man. In sampling the cream the same methods are used as for milk, except even greater care is necessary to get a fair sample, as cream is often difficult to get into a uniform mixture. Before taking a sample from a bottle for testing, it is generally advisable to warm cream to near 100°, as it will then more easily mix into a uniform condition. Pouring from one jar to another is the best method of mixing. If the cream contains more fat than can be read on the scale on one cream bottle, a pipettefull may be divided about equally between the two bottles. A pipettefull of water is also divided in the same manner.

"If cream is tested by measuring out with 17.6 c. c. pipette, as is done with milk, the reading will be too low for two reasons. The basis of the Babcock test is eighteen grams. The 17.6 c. c. pipette delivers this weight of milk, but as cream is more adhesive than milk, a considerable amount will stick to the pipette. In sour or thick cream this error may be as much as 1.5 per cent. This error is easiest removed by filling the pipette about one-third full of warm water, shaking to loosen the cream from the sides, then adding this to the cream in the bottle. The other cause for error is on account of the lightness of the cream, as compared with milk. A 17.6 c. c. pipette full of cream does not weigh quite eighteen grams, the regulation amount, but somewhat less, depending upon the richness of the cream. If it is necessary to have an exact test of cream, it can be obtained best by using delicate scales and weighing out the desired amount. Scales especially arranged for this purpose can now be purchased at a reasonable price.

"The temperature at which cream bottles are read is of great importance. A difference of over 1 per cent can be made by changing the temperature from 110 to 180 degrees—extremes often met with in various testers. The exact temperature at which reading is correct has not yet been determined, but should be somewhere about 120 degrees. The best way to get bottles at a proper temperature is to set them in a pan deep enough to bring the water up near the top of the bottle.

"The details of sampling and testing required are worthy of the factory man's most earnest attention and care. The Babcock test, under proper conditions of use does exact justice to all, and instead of being a cause of friction between patron and creamery, it should be a peacemaker and judge that increases business and encourages improvement among the herds of the dairymen. It pays to do your testing carefully and honestly. It pays as a business policy, leaving out for the moment the questions of right and wrong. It pays to give every man just what he is entitled to—no more and no less. I believe a creameryman should know where he furnishes a set of tests that he should be able to go before court and swear they are correct. It does not take the patrons of a creamery long to find out whether the testing is being done carefully or not. I do not believe it pays for a man to attach an air of mystery to the method of testing or to keep the time of testing a secret and allow no patrons to be present. Rather announce the time the testing is to be done and invite all to be present, and demonstrate how simply the system is carried out. Let a factory manager once gain the confidence of his patrons by accurate, careful work and the trouble over this question at the factory is about over."

Strong for the Silo.

The roughage for our cattle consists of alfalfa, which we grow at the rate of four tons to the acre, and silage made from corn which we grow at the rate of twelve tons to the acre. We have put some alfalfa into the silo with remarkably good results, and in case the weather is wet at any cutting this is the way we cure it. I would not attempt to keep a dairy of five cows or more without a silo. The one which we are now using is one of the Harder patent fronts, sixteen feet wide and thirty feet deep. It is made of cypress without a knot in it.

You ask if a silo would pay on a small farm. Ours is a small farm, only about 100 acres, and still we keep fifty head of cattle on it, beside twenty-five sheep. We feed silage to everything on the farm, including the hogs, and believe that it is economy to do so.—F. E. DAWLEY in *Farmer's Guide.*

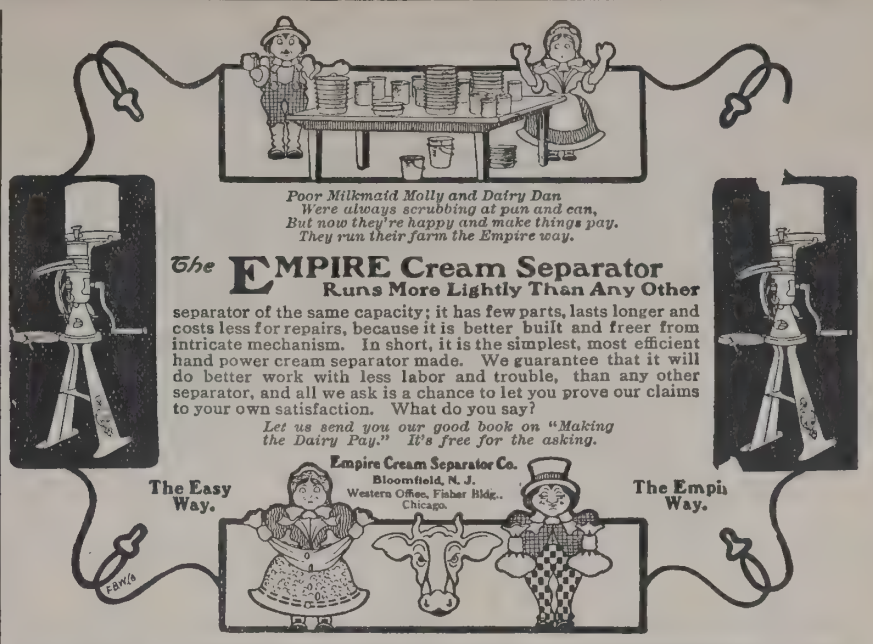
TWO TIPS

And Both Winners.

A man gets a friendly tip now and then that's worth while.



A Nashville man says: "For many years I was a perfect slave to coffee, drinking it every day and all the time I suffered with stomach trouble and such terrific nervousness that at times I was unable to attend to business and life seemed hardly worth living. I attributed my troubles to other causes than coffee and continued to drench my system with this drug. Finally I got so bad I could not sleep, my limbs were weak and trembling and I had a constant dread of some impending danger and the many medicines I tried, failed to help me at all.

One day a friend told me what Postum had done for her husband and advised me to quit coffee and try it, but I would not do so. Finally another friend met me on the street one day, and after talking about my health he said: 'You try Postum Cereal Coffee and leave coffee alone,' adding that his nervous troubles had all disappeared when he gave up coffee and began to drink Postum.

"Thfs made such a great impression on me that I resolved to try it, although I confess I had little hopes. However, I started in and to my unbounded surprise, in less than two weeks I was like another person. All of my old troubles are now gone, and I am a strong, healthy, living example of the wonderful rebuilding power of Postum. It is a fine drink as well as a delicious beverage and I know it will correct all coffee ills; I know what a splendid effect it had on me to give up coffee and drink Postum." Name given by Postum Co,, Battle Creek, Mich.

There's a reason.

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

FORT ATKINSON, WIS.

Oil Meal and Bran.

ED. HOARD'S DAIRYMAN:—Kindly advise me in your "Inquiries and Answers" if oil meal in connection with bran will make a satisfactory grain ration for cows having heavily grained ensilage, clover hay and shredded corn stover for roughage. If oil meal can be secured at lower cost per unit of protein content, is it advisable to make it the principal protein food of ration and if not why not?

Grass Lake, Mich. C. B. C.

Oil meal contains approximately one-third more units of digestible nutrients than bran. Therefore if bran can be bought for $15, oil meal would be worth only $20 for merely nutritive purposes. But oil meal has certain dietetic properties not found in bran, and carries a much larger per cent of protein, but when fed in excess even for these purposes it has a tendency to impart a not altogether acceptable oily flavor to milk and butter, and in addition injures the butter texture.

Silage, roots and green fodders of any kind, as well as pasture grass, will answer about the same dietetic purpose as oil meal, and when sufficient protein can be obtained by using more or less bran, it would not be advisable to make oil meal the principal protein feed in a ration.

The following formula illustrates this conclusion:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
6 lbs. clover hay	5.08	.41	2.15	.10
6 lbs. corn stover	3.40	.10	1.94	.04
6 lbs. bran	5.28	.75	2.32	.12
2 lbs. oil meal	1.92	.59	.65	.14
Total	23.60	2.24	11.26	.61

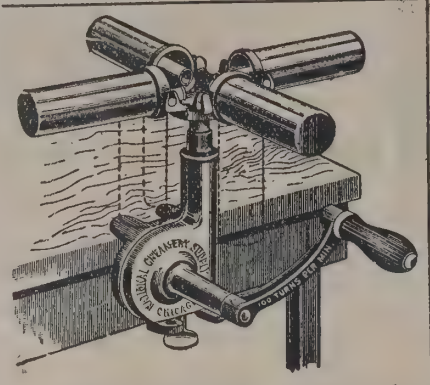
CONCERNING OUR ADVERTISERS.



With this issue the season's advertising of the familiar Monarch French Burr and Attrition Feed Mills starts. Old readers remember the advertisements from past seasons. These mills have found their way into the feed barns of many who read this paper. If there had been any note of dissatisfaction we should be sure to know it. These Monarch Mills are admirably adapted to the feeder's purposes. We have no hesitation in recommending them unreservedly But an intending buyer need not buy on faith. Note the liberal time given to try before consummating the purchase. It shows the serene confidence the manufacturers have in their product. Catalog with full description can be obtained by writing the manufacturers, Sprout, Waldron & Co., Box 208, Muncy, Pennsylvania.

We have just received from the Standard Paint Company of New York and Chicago, manufacturers of the well known Ruberoid Roofing and the Giant and P. & B. Products, a specimen piece of Giant Insulating Paper taken from the buildings of the Artic Ice & Cold Storage Company, of Buffalo, New York. As the Giant Papers are so widely used for sheathing buildings, poultry houses, stock barns, and for lining silos, for the purpose of making them air-tight and water-proof, it is interesting to note that the sample sent us is still in perfect condition after thirteen years of instillation. There is absolutely no sign of deterioration and the paper is still entirely soft and pliable and full of insulating life. In fact, upon comparing it with a piece of unused paper we find that it is as good as new and could probably be used for as many years longer. The Giant Papers are remarkable for their peculiar pliability and elasticity. They are made of tough, strong stock of fine quality. Their peculiar feature is their saturation with the Giant Water-proof and Acid proof Compound which is manufactured solely by the Standard Paint Company, and the perfect condition of the paper after its long use speaks well for the peculiar non-oxydizing qualities of the Giant Compound. We consider the test mentioned as remarkable and one which should appeal to users of sheathing papers, whether for dwellings, poultry or stock barns, or for silos. The paper permanently excludes all draughts and dampness. It has been Standard for eighteen years and is everywhere well regarded because of its durability.

DAIRY MARKETS.

ELGIN, Ill Sept. 21 —Butter was quite at 21½c a pound on the board of trade today, an advance of 1½c over last week's figures. The sales for the district during the week were 702,832 pounds.

SUNCOOK VALLEY CREAMERY CO.,
SUNCOOK, N. H.

Big Success With Hogs

SOME farmers are more successful with hogs than others. The man that only gets 8 lbs. of pork out of a bushel of corn fed to hogs makes only half as much as the man that gets 17 lbs.

The American Swineherd is a specialist and the best authority on the hog industry.

Prof. Henry says that success is only obtained by concentrating all efforts upon one line.

A two-years' course in hog raising:
Teaching how to be successful.
How to secure the greatest profits.
How to get 17 lbs. of pork out of a bushel of corn and 19 lbs. from a bushel of wheat-fed hogs.
How to feed to double the growth and gain over usual methods; only healthy hogs profitable.
How to keep your hogs healthy.
How to utilize, without other expense than the subscription to this paper, the costly experience and gathered wisdom of the most capable and successful feeders.

Prof. Kennedy of the Iowa Agricultural College says "Your paper is a leader in its line on feeding."

Every owner of hogs should take advantage of this special offer:

Send us $1 for two years' subscription to the **American Swineherd** and it will entitle you to a free copy of the Hand Book on "Hog Hygiene," with trade secrets, receipes, valuable information, etc. If the offer is accepted in ten days we will send you in addition the wonderfully suggestive picture in colors, "Uninvited Guests," suitable for framing, showing the pigs partaking of a meal uninvited.

This equips you for a successful hog business.

AMERICAN SWINEHERD,
535 Como Bldg., Chicago, Ill.

Water In The Stable a Necessity.

It is universally acknowledged that stock in the stable should have constant access to water of suitable temperature, and all progressive Dairymen are putting in some form of Watering Device. Why not use the Best? Write for descriptive circular.

BALTIMORE MARKET.

BALTIMORE, Md., Sept. 17.—Butter—Although the dairymen in certain sections report a shrinkage in the milk supply, receipts since our last report have continued fairly liberal, and with the exception of an advance of a ½ cent on fine creamery, there is little or no change to note in the general condition of the butter market. The local consumptive demand continues very good, and dealers generally are taking their regular lots promptly. The receipts of extras and firsts are about on a par with the demand; while seconds and under grades are in ample supply. Imitation creamery of desirable quality continues in moderate receipt. Ladles—The supply is about equal to the requirements. Packing stock, since our last issue, has been in more liberal receipt; all arrivals have so far met prompt sale. Blocks and prints—All choice to fancy invoices find quick sale, while defective lots are exceedingly dull and in many instances have to be sold for packing purposes. The market generally rules firm, but the impression seems to prevail that creamery is high enough for the present, and any further advance in the near future would likely prove detrimental.

Creamery Separator, extras, 21@21½c; firsts, 19½@20c; seconds, 17@18c. Imitation Creamery, extras, 18c; firsts, 17c; seconds, 15@16c. Iowa & N. W. Ladle, extras, 16½c; firsts, 15@15½c; seconds, 13@14c; Ohio & Indiana Ladle, extras, 16c; firsts, 15c; seconds, 13@14c. Creamery blocks, (2-lb.) extras, 22@22½c; firsts, 21c; seconds 18@20c: Creamery prints (¼ lb) extras, 23c; firsts, 22c; seconds, 18@20c. Md. Va. & Penna., prints, extras, 21c; firsts, 19@20c; seconds, 18@19c.

Eggs—With continued light receipts of strictly fresh eggs, and a brisk demand at 23 cents, the market to-day presents a very healthy appearance and closes firm and fairly active on all desirable offerings either fresh or storage.

Cheese—Receipts fair; demand good; market firm and active.

N. Y. State—Cheddars, fine, 11⅜@11½c; choice, 11@11¼c; fair, 10¼@10¾c, Flats, fine, 11½@11¾c; choice, 11¼@11½c; fair, 10¾@11c; Small, fine, 11⅞@12c; choice, 11⅛@11¾c: fair, 11@11¼c; Ohio Flats, fine, 11@11½c; choice, 10½@10¾c; fair, 9½@10c; Ohio Picnic, fine, 11½@11¾c; choice, 11@11¼c; fair, 10¼@10¾c; Swiss cheese, (domestic) new, fine, 13@13½c; choice, 11@12c; fair, 9@10c.

301 Exchange Place. G. M. LAMB & BROS.

NEW YORK MARKET.

NEW YORK, Sept. 21—Butter—Receipts for the week, 44,590 packages.

Exports for the week, 1,325 packages.

Lighter receipts and favorable weather caused an advance in the market. Prices are firm at the close, with higher tendencies. We quote:

Creamery, extra, 21c; medium, 19@20c; poor, 16@18c; Dairy, extra, 20c; medium, 17@19c; poor, 15@16c.

Cheese—Receipts for the week, 36,393 boxes. Exports, 4,239 boxes.

Market has been decidedly firm all the week, exports having bought freely and are anxious for next week's receipts. Home trade bought freely of fancy flats. There was an increase in the sales of all grades skimmed cheese, the ruling price being about 9c for finest. We quote:

Full Cream, extra, 11¼c; medium, 10½@11c; poor, 7@9c.

Eggs—Receipts for the week, 48,941 cases.

There is a demand for all strictly fresh eggs at full prices, The market in general is very firm on all grades. We quote:

New York & Penn., finest selections, per doz, 24@25c; Northern & Western, finest selections, 23@24c; all sections, poor to good, 17@22c.

500,000

Cream Separators in Use and 500,000 Dairymen Adding to Their Wealth as the Result.

Our ten-years-ago would-be competitor who uses space on the front cover of this paper had the audacity to use the above heading to an advertisement in last week's issue.

There is no need of a better index to the quality of the advertising of the average separator "boomer" than this very example. Naturally the impression intended to be given was that these machines were of the advertisers own make, but a second look will show that no such claim was made, and of course very few of them really are.

The advertiser might have added that perhaps 5,000 of them were his own make and that nearly all of the rest were DE LAVAL made, but that would have caught no fresh victims of "cheap" separators.

The new buyer of a separator may well profit by the experience of the longest and largest users of them—and that inevitably means a DE DAVAL machine.

The De Laval Separator Co.

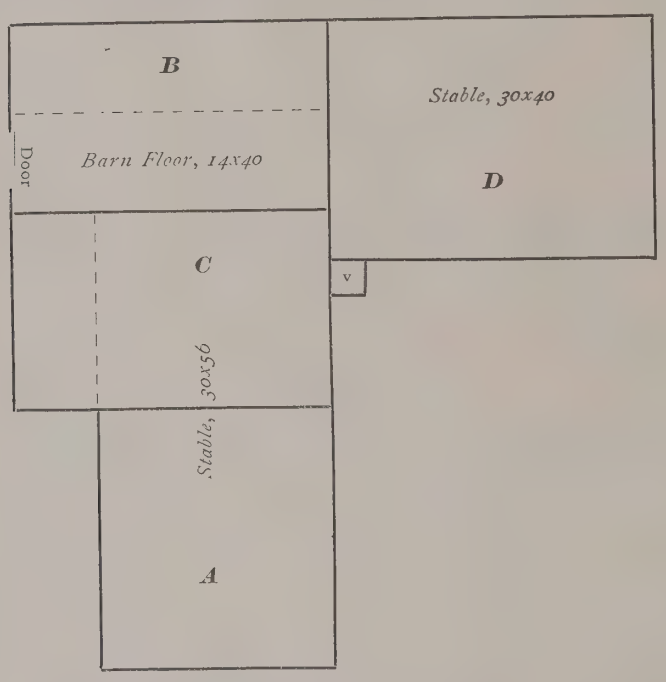
Kniskern, Passenger Traffic Manager, Chicago, or call on Ticket Agent for copy of handsome Chicago Centennial Folder, issued by the North-Western Line, profusely illustrated, giving an outline of the program for Celebration Week, a brief reference to Chicago's early history and the relation of The North-Western Line to the industrial progress of the city. For further particulars apply to Agents Chicago & North-Western R'y. 30 4

Very Low Rates to San Francisco and Los Angeles, Cal.—Via the North-Western Line. Excursion tickets will be sold Oct. 8 to 17, inclusive, with very favorable return limits, on account of convention of American Bankers' Association. Apply to agents Chicago & North-Western Ry. 33-4

Consolidating Barns.—Manure Basements.—Ventilation.

ED. HOARD'S DAIRYMAN:—I have four buildings: A, 30×32; B, 24×40; C, 24×40, and D, 30×40, which I wish to put together in such a way as to make, as nearly as possible, a modern dairy barn. Will you kindly make suggestions on the plan which I inclose, remembering that this must be done with a limited amount of money and all help and material very high, also that the ground is dry, sandy soil, with a good chance to drain to the north and south away from the house, which is below the barn.



First—Does this soil call for a ditch under the wall?

Second—Are stone broken with dynamite all right for building wall?

Third—Will basement under this barn prevent the use of the King system of ventilation? I am sure you will object to using basement under cow stable to store manure, but the lay of the land with reference to the house is such that it can hardly be stored elsewhere, and we purpose to draw it out often, using land plaster, sawdust and other absorbing material.

Fourth—Will two layers of one-inch boards be all right for all floors except stable?

Fifth—Will you please show how many and how large the inlets for fresh air and the outlets for foul air should be?

It seems to be most convenient in this plan to have the cows face central feeding alley. You will say that 30 feet is too narrow for two rows of cows, but it will be much wider than I have used for the past 17 years, and using this building as it is without changing roof, will save much expense. Placing end of main barn toward the west against the bank and using cross section plan given on page 589 of DAIRYMAN, I wish to drive in 8 feet high, that is, 8 feet above top of basement. In this plan do you have a purline plate? According to your plan, I will have still 26 feet high for driving in to unload, which seems higher than necessary. If you do not have purline, how are rafters joined? BLANK.

New Haven, Vt.

Our Vermont friend not only omitted to enclose his proposed plan for assembling these four buildings and consolidating them into one, but also forgot to append his name to his letter. We much regret these omissions, for his plan would not only have contained some general suggestions to aid us, but, what is more to the purpose, would have offered some indications of the peculiar conditions affecting the problem.

As an original proposition, we incline to a program substantially as follows:—Bring the two buildings, B and C together, side by side, making one structure 40x48 feet, divided through the center by the frame work of one of the sides in each structure. On one side of this center, have a drive-way or barn floor, preferably 14 feet wide, and on a level, or but slightly higher than the floor over the basement. It is much better to elevate the hay with a horse-fork than to have either a long or a steep grade to reach the barn floor. The space remaining after deducting for barn floor will make an excellent place for storing grain and tools and the unobstructed 24x40 feet of the other building will store nearly as much hay as two bays 14x48—or four bays each 14x24.

Bring up the buildings A and D and attach one on the east of this consolidated central building and one on the south, so as to form the north and west sides of a yard, substantially as shown in the accompanying diagram, provided one can be content for all future time with stables only 30 feet wide in exterior dimension.

We should personally much prefer, and do not hesitate to advise our correspondent, if it can be done without too much expense in changing roofs, to turn buildings A and D one-quarter around, presenting the 32 and 40 feet sides to the main central structure and thus making the stables that much wider.

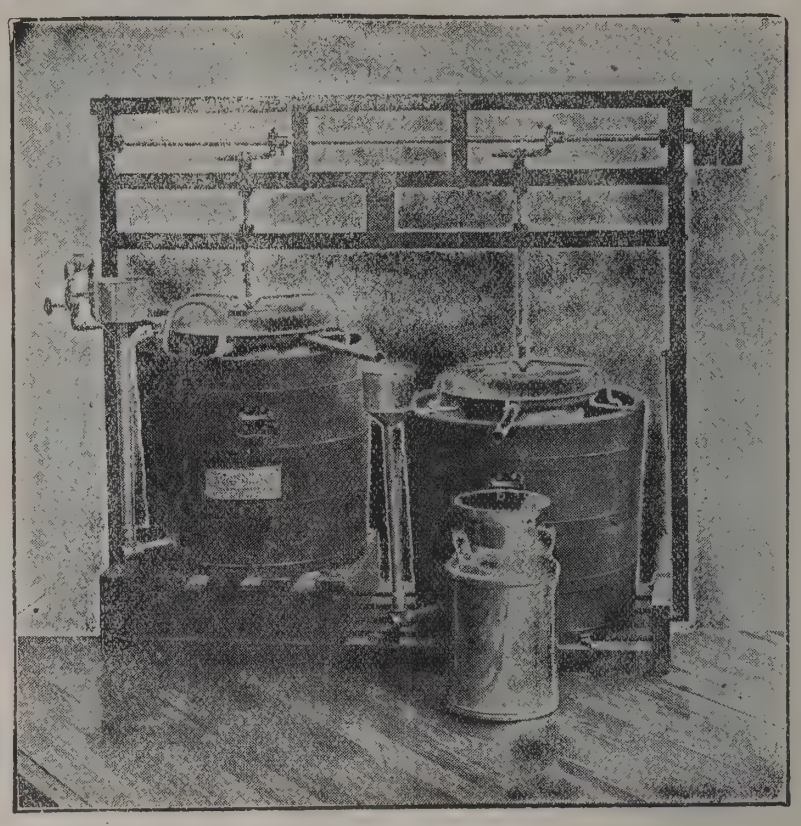
In either case, there will be greater economy of space and greater convenience in doing the work to face the cows towards the sides and have a central driveway, 8 feet wide, for hauling out the manure, and for admitting and turning out the cows. On either side of this alley or driveway, there may be a gutter or trench 12 inches wide, then standing platform for cows, 4½ feet wide, which will leave 4½ feet on each side clear for feeding, or, if mangers are insisted upon, 2½ feet for passage and 2 feet for manger.

Build a foul air shaft not less than 4x4 ft. in the corner, as shown at V and inlets for fresh air, not more than 12x12 inches at convenient places on all sides of the stables. These fresh air inlets

The Elwell Kitchen Cabinet

SOLD ON APPROVAL

We shall not attempt to describe it here but invite you to send for our new booklet.



"THE LABORATORY OF THE HOME."

It puts the work of the kitchen upon a business basis—everything handy, sanitary, dust-proof and mouse-proof; easy to keep fresh and clean. Booklet tells why.

Thousands of our cabinets sold—eight styles. Every home-maker wants one. Write to-day for booklet. A postal card will do.

Elwell Kitchen Cabinet Co. 926 5th Ave. S. E. Minneapolis.

A GREAT SUCCESS.

BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the **Buhl Factory, "Improved Elgin" and Genuine Iowa Cans**; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

must open interiorally at the ceiling or top of the stable and outwardly 3 feet or more lower.

If there must be manure basements, see that independent ventilating flues are built for them.

We do not consider this soil calls for drain tile under the walls; we know of nothing that would exclude from use the stone broken with dynamite; two thickness of inch boards, are everywhere preferable to plank for floors; in the sketch referred to there are no purlin plates, but the rafters are tied together with a 10 or 12-inch board, securely nailed across the angle, and thus form a strong, self-supporting arch.

Virginia Inquiries.

ED. HOARD'S DAIRYMAN:—I run a dairy of about thirty-five cows, milking at present twenty-six; milk 2 a. m. and 12 m. I am only getting thirty-five gallons milk per day. They have green sorghum, as much as they will eat, and a fair pasture to run in with plenty of water, (they drink very little), and ten qts. of grain a day,—one quart meal and four qts. of bran at a feed. Can you change this ration to make them do better?

Also the best method for curing pea hay.

And the plan for a small milk room for bottling about 200 quarts per day.

Old Point Comfort, Va. P. W. J.

These cows appear to be receiving enough feed to enable them, if properly handled, to produce more than an average of 12 lbs. of milk per day. If the "meal" is cotton seed meal, the two quarts will weigh about three lbs. and the eight quarts of bran should weigh about 5 lbs. It will be a difficult matter to increase the yield very much now, as when a shrinkage is once established it is liable to persist. If not already doing so, try giving a large teaspoonful of salt with each feed of grain, and see that the milking is closely supervised. We suspect that the trouble has been more in the milking than the feeding. Milkers that are set to work at 2 o'clock in the morning, if not closely supervised, will not be apt to be particularly patient with the cows or particular to milk out the last few drops. Leaving even a little milk in the udder is a sure way to bring about a decided shrinkage.

From lack of experience, we must refer the question as the the best method of curing pea hay to our readers for answer.

A milk bottling room may be of almost any shape, but should not be so connected with a barn or dwelling as to admit of any contamination with either. It should, as a matter of course, be kept scrupulously clean, and to this end no one from the stable or kitchen should be allowed to enter it. Preferably, the floor should be of cement, and slanting to the center or one side with a drain to carry off the wash water so handily that there can be no excuse for omitting to scrub and flush it every day, or oftener if used more than once daily.

If one is really in earnest about wanting to be up-to-date in producing and handling milk for family consumption, he will find the book "Clean Milk" by Dr. S. D. Belcher, a valuable assistant. We do not know the price of this book, but an inquiry addressed to The Hardy Publishing Co., New York City, will receive courteous attention.

Fall Treatment of Alfalfa.

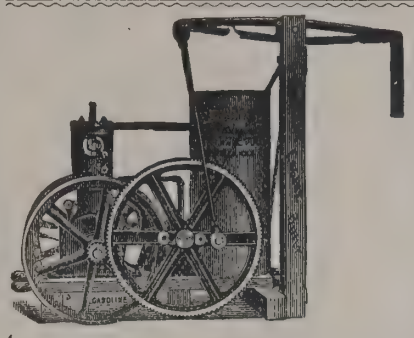
ED. HOARD'S DAIRYMAN: — I have about one quarter of an acre on which was secured a very good catch of alfalfa, using oats as a nurse crop. It hasn't been cut since the oats were taken off and would average now about five inches in height. Am very anxious to get this through the winter without injury and should like your advice as to what to do.

Have thought of manuring quite heavily, and then covering the alfalfa with well dried, wild grass—raking it off in the spring.

Would you advise this or would you use manure alone? J. F. C.

E. Charlotte, Vermont.

Would advise letting entirely alone. After the ground is frozen for winter then give it a good top-dressing of barn yard manure.

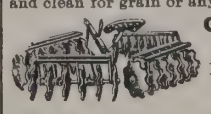


WEBER JR. Gasoline Engines are the outgrowth of 19 years of engine building. Not approached for strength, safety, simplicity or width of duty. Valuable for a score of farm duties. Any boy can run them. 2½ full horse power at less than 5 cts. per hour. Tested and ready for action upon arrival. Made to fit farmers' needs. Other sizes up to 500 h. p. Write for free catalogue.
WEBER GAS & GASOLINE ENGINE COMPANY, Box 178, Kansas City, Mo.

GOOD INTENTIONS ALONE CANNOT PRODUCE GOOD MACHINERY. Most all manufacturers are honest, but lack the experience and equipment necessary to turn out a thoroughly first class engine. We are the founders of the Gas Engine industry in the United States; have been building **OTTO** engines for 27 years, and operate the largest and most complete plant in the country devoted exclusively to the building of Gas and Gasoline Engines. Which will you buy, **Otto Experience** or **Others' Experiments**
THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

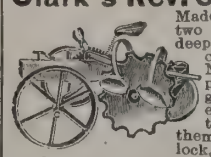
DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED **"THE MASTER WORKMAN"**
A two-cylinder gasoline engine; superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started. Has a wider sphere of usefulness. Has no vibration; can be mounted on any light wagon as a portable. Weighs less than half of one cylinder engines. Give size of engine required. Sizes 1½, 2, 2½, 4, 5, 6, 8, 10 and 15 horse power. Mention this paper. Send for catalogue. THE TEMPLE PUMP CO., Meagher and 15th Sts., CHICAGO.

You will be well pleased if you buy a
WATERLOO GASOLINE ENGINE
Write for catalogue descriptive of Stationary, Portable and Pumping Engines.
WATERLOO MOTOR WORKS, WATERLOO, IOWA.

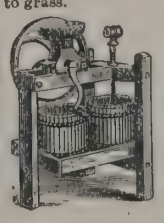


No Water here to Freeze

If you want a..... **Gasoline Engine**
that will be always ready to start, safe, reliable convenient, economical and durable, buy a FULLER & JOHNSON Frost Proof. No bother with water nor expense of broken cylinder, no waiting for wind or weather. All sizes, stationary and portable. Send for descriptive catalogue to the manufacturers
FULLER & JOHNSON MFG. CO., Madison, Wis.

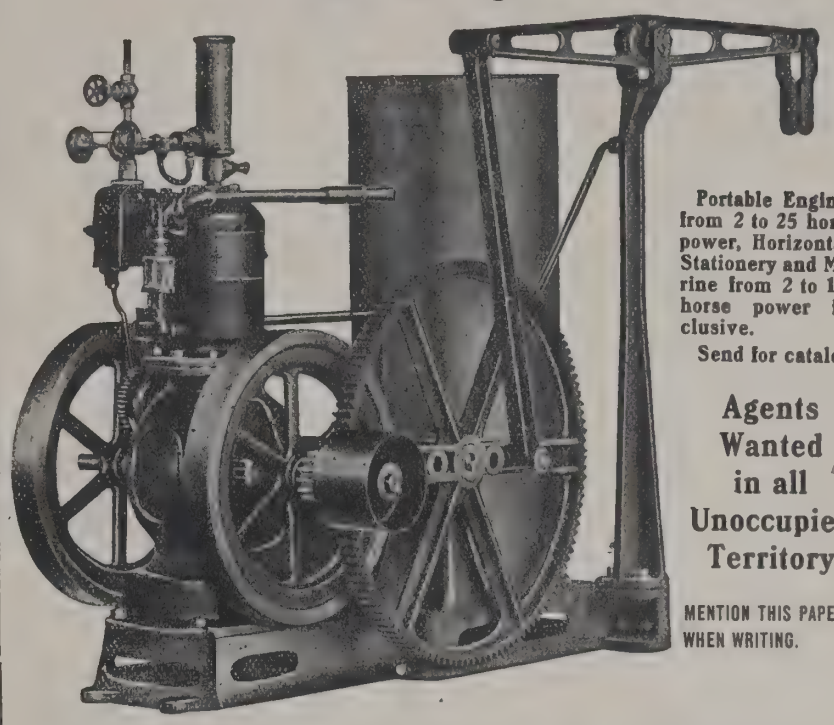


Clark's Tools for Large Hay Crops

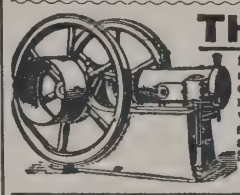


CLARK'S REVERSIBLE Bush Plow and Harrow

Cuts a track 5 ft. wide, 1 ft. deep. Connects the sub-soil water. It is an excellent machine for covering in sugar cane. Strength guaranteed. Can plow a newly cut forest, stump, bush or bog land, leaves the land true and clean for grain or any crop.



Clark's Dbl. Action Cutaway Harrow Moves 15000 Tons of Earth a Day.



Clark's 8 foot Smoothing Harrow. Will smooth an acre as true as a mill pond in twenty minutes.

Clark's Rev. Sulky Disk Plow

Made single or double. One or two furrows five to ten inches deep; 14 inches wide. For two or four horses. Light draft. No side draft. No similiar plow made. When Clark's grass tools are used as directed in his grass circular, we, the C. H. Co., guarantee them to kill wild mustard, charlock, hard hack, sunflower, milk weed, morning glory, Russian thistle or any other foul plant that grows, or money refunded. Now is the time to commence work for next year's seeding to grass.

CLARK'S CIDER MILL

Horse, Hand, or Steam Power. From five gallons to eight barrels.
PERFECT GRIND
Will grind 75 bushels per hour easily.
Send for Circulars.

Selecting a Short-horn Calf to Cross on Jersey Cows. —Watering Silage.

ED. HOARD'S DAIRYMAN:—1. We are going to select a Short-horn calf to raise for breeding purposes in our Jersey herd. What points should be observed in selecting one, and what method of feeding would be best to follow the first year?

2. How much water should be put on 100 tons of silage, when the corn is put into the silo a week or two before it would be ready to shock? G. J. B.
Galesburg, Mich,

1. It is hardly fair to ask us how to do something that we are utterly opposed to. We feel very certain that it is a mistake, that will cause deep regret, to make the cross contemplated. It may minimize this mistake to a degree, to get a calf that has a dam and grandam with authentic and satisfactory dairy records, if such can be found. A calf of any breed is a very poor index of what the mature animal will be. About the only "point" in a calf of either sex indicative of future dairy ability is the location of the rudimentary teats. If these are squarely placed and well separated, the presumption is, the animal, if a heifer, will develop a well shaped udder; and if a bull will produce heifers of similar conformation. If a bull calf of Short-horn breeding, combining proper heredity with well placed rudimentary teats is obtained, one may do something towards perpetuating his dairy tendencies, by feeding principally upon skim milk and first quality hay, with but little grain of any kind, and that of a bulky and nitrogenous character, such as bran or oats.

2. Corn in the condition named needs no extra water added as it goes into the silo, unless it be to wet the sides to facliate settling. When the filling is completed, wet the surface as thoroughly as an extra heavy shower of rain would.

HOLSTEIN BREEDERS

ATTENTION!

A party desiring to purchase a number of thoroughbred Holstein cows under eight years old, requests that those having any for sale should send to this office brief outlines, showing breeding for three generations, with records both of individuals and ancestors, either private or official, general description and price, bearing in mind that none but the very best are wanted.

CHOICE BULLS FOR SALE.

Also Cows and Heifers bred to Clay Buttercup, 126851, a descendant of the Clay Family, champions at the World's Fair dairy test.
GEO. WENHAM, Fort Atkinson, Wis.

Elgin Milk Prices for the Coming Year.

ED. HOARD'S DAIRYMAN:—The various large milk factories in this section made their semi-annually contracts this week. The Borden Condensed Milk Company, for their factories at Elgin, Carpentersville, Belvidere, St. Charles, Dixon, Genoa Junction and the minor bottling plants, paid an average of $1.46⅔ per hundred pounds for the six months. The prices per hundred per month were:

October	$1.35
November	1.45
December	1.55
January	1.55
February	1.50
March	1.40

This is 5 cents per hundred more than the contract price for the corresponding period of last year, yet the producers are not satisfied. The farmers claim that the advance in the price of feed and the increased demand of help far more than counteracts the small advance paid by the company, and that the cost of production will be at least 10 cents more per hundred than it was a year ago.

Oatman Bros., at Dundee, contracted for 25,000 pounds of milk daily, paying as follows:

	Per hundred.
October	$1.50
November	1.50
December	1.50
January	1.45
February	1.45
March	1.40

The Sherwin creameries at St. Charles and the Elgin Butter Co. pay two cents per hundred less than the Borden Co. The Sherwin factory will use 30,000 pounds daily; the Elgin Butter Co., 20,000 pounds, and the Borden Co., 100,000 pounds at its Elgin factory.

The resolution adopted on Monday by the Elgin Board of Trade was, in full, as follows:

WHEREAS, Our state legislature has provided $250,000 to have our state properly represented at the World's Fair at St. Louis in 1904, and

WHEREAS, The dairy interests of the state should receive a portion of this appropriation to make a suitable showing, so that they may compare favorably with the exhibit made by other states, therefore be it

Resolved, That we, the Elgin Board of Trade, representing twenty thousand dairymen, and whose products sold last year at over eleven million dollars, request the Illinois Commission to the Louisiana Purchase Exposition to set aside $15,000 to be used in making a suitable display, exhibit, or working dairy during the exposition, the same to be arranged for and to be under the direction of a committee of seven, two to be appointed by the Illinois State Dairymen's Association, two by the Elgin Board of Trade, two by the Chicago Butter Board and A. J. Glover of the Illinois College of Agriculture Experiment Station, but under the control of your commission."

The resolution was unanimously adopted and the secretary instructed to notify the Illinois commission and the Chicago Butter Board. H. C. B.

Elgin, Ill.

Tests Accepted for Record by the American Jersey Cattle Club.

CONFIRMED TEST.

Ella Golden 149309—Sire, Stoke Pogis of Prospect 29121; dam, Ella of Endegeest 88376. Milk, 332.6 lbs.; fat, 16.244 lbs.; estimated butter on basis of 85 per cent fat, 19.11 lbs. THE

"1900" FAMILY WASHER FREE

Greatest Invention of the Age. Labor and Expense of Washing Clothes Cut in Two.

No More Stooping, Rubbing or Boiling of Clothes.

Every Household Needs One.

THE "1900" BALL-BEARING FAMILY WASHER SENT FREE

to anyone answering this advertisement, without deposit or advance payment of any kind, freight paid, on 30 days trial. The "1900" Ball-Bearing Washer is unquestionably the greatest labor-saving machine ever invented for family use. **Entirely new principle.** It is simplicity itself. There are no wheels, paddles, rockers, cranks or complicated machinery. It revolves on **bicycle ball-bearings,** making it by far the easiest running washer on the market. No strength required; a child can operate it.

No more stooping, rubbing, boiling of clothes. Hot water and soap all that is needed. It will wash **large quantities of clothes,** no matter how soiled, **perfectly clean in 6 minutes.** Impossible to injure the most delicate fabrics.

An Enthusiastic Admirer.

Chicago, Ill., March 22, 1903.

The "1900" Washer Co., Binghamton, N. Y.

The washer that I bought from you nearly 2 years ago is in the best condition yet, and I believe it always will be; nothing has been worn out or broken off; every part is as good as it was when I bought it. Neither have I noticed that my clothes through the continuous use of the washer have been worn out. Your washer don't rub the clothes to pieces or wear them out. It is really the best washing machine on the market, and if I could help it there would not be a house-wife in the United States without one of your "1900" ball-bearing washing machines. I heartily recommend it to every lady, for it will save her a lot of hard work.

Mrs. A. H. CENTNER, 666 Diversey Boulevard.

Property of estate of W. S. Ladd, Portland, Oregon.

Milky Brine in Butter.

Cause and Remedy for White Specks—Churning Temperature and Washing.

Prof. E. H. Farrington, in *Country Gentleman*, presents a letter of inquiry and his reply to same, commenting as follows:

"I am having trouble with milky brine in my butter, and cannot find what causes it. It is not in every churning, and some churnings are a great deal worse than others. To-day was the worst I ever had. When I worked the butter, the brine that came from it was like buttermilk, and it left particles of curd all through the butter to such an extent that I fear it won't pass as an extra.

"This churning of cream was not ripe enough; it had not thickened, but I have had the same trouble with cream that was in prime shape for churning, only not so bad. And I have had a nice clear brine from cream that was no riper than this. I thought that reworking might improve it, but the curd is in granules about the size of a pinhead and quite hard, and I doubt if reworking would affect them." A. N. T.

Picketts, Wis.

The milky brine in butter is usually caused by churning the cream at too high a temperature, and not allowing the buttermilk to drain thoroughly from the granular butter after churning. The experience described indicates that the milky brine is caused by overripe cream, and by failing to strain this cream into the churn. The pieces of curd which are the size of a pinhead and quite hard, evidently come from curd in the cream which was so sour that the curd contracted into hard lumps, and then was not removed when the buttermilk was drawn. If these pieces of curd are so small that they will pass through any strainer used for straining the cream into the churn, they may be removed by washing the granular butter in the churn in the following way:

After the buttermilk has been drawn off, fill the churn two-thirds full of water. The granular butter will all rise to the surface, because butter is lighter than water; the hard lumps of curd, however, being heavier than water, will sink, and they may be drained off with wash water through the drain spout at the bottom of the churn. This washing and draining off of the wash water should be repeated until by inspection it is shown that these small lumps of fine, hard curd are all removed. In this way the granular butter is cleaned from curd, so that it may be salted and worked ready for packing.

The letter does not state what kind of cream is received at the factory. If it is from milk which is separated at the factory, there is no excuse for having these hard pieces of curd in the cream, because under such circumstances the buttermaker should control the ripening of the cream, and churn before it sours to such an extent that the curd coagulates and separates from the fat of the cream. If, however, the factory receives hand separator cream from farmers, the buttermaker is not entirely responsible for this condition of the cream.

In such a case it is probable that some farmers send a very sour cream, and it is the curd from this sour cream that is causing the trouble with the butter.

The ordinary milky brine which butter sometimes has without the presence of these white specks of curd, may be easily overcome by churning the cream at a temperature below 55 deg. A rich cream churned at this temperature ought to give a very clear brine—in fact, when the buttermilk is drained off, it may often be noticed that the last portion of the buttermilk as it comes from the churn, is thin and watery, and looks more like water than buttermilk.

If a milky brine is formed even when the cream is strained into the churn, and churned at a low temperature, the milkiness may be removed by adding strong brine to the churn just about as the cream breaks into granular butter.—*Dairy Produce.*

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Poison Perhaps.

I have a cow that calved the 12th. of Aug. She appeard to be all right until the a, m. of the 4th of Sept.(the placenta came away, no discharge) Then we noticed her throwing her head and acting a little strange. When brought up at milking time in p. m. she was vomiting and frothing at the mouth, pulse quick, looking wild in the eye; bowels very distended, breathing labored. She gave the usual quantity of milk in the morning, but very little at night. She died during the night. Could she have been poisoned with a drug? B. B. B.

Litchfield Co, Conn.

ANSWER.

No. 1 If you don't know the action of a drug, nor the nature of the disease, it is best not to dope the animal at all. For many an animal is killed by administering medicine, which is contra indicated.

No. 2 If you will describe the disease, which is new to you, we will endeavor to find the proper name for it.

How to Use the Teat Bistoury.

Please explain more fully the method of using a teat bistoury and the treatment necessary afterwards. We have a cow with hard rings in two of her teats, making her quite hard to milk. They are very sore at times and then give off a very yellow milk for a few milkings. What treatment is necessary? Is the teat bistoury a safe and sure remedy for hard milking cows? G. J. B.

Galesburg, Mich.

ANSWER.

Insert the bistoury into the teat and through the obstructed parts, push the shaft so that the blade will portrude to such an extent as you wish to cut. Then draw the bistoury downward, cutting through the obstruction. Cut in the same way in four opposite directions. There is no further treatment necessary but to keep on milking. This will keep the channel open, and it will stay open, owing to the flow of milk. Hard milkers are treated likewise; it is an immediate relief. Be sure to leave the bistoury thoroughly clean.

Warts.

I have a fine cow five years of age all right in every way except her teats are completely covered with warts. O. E. E.

Bar Mlils, Me.

ANSWER.

Clip them off with a pair of sharp scissors and touch up the parts with a stick of lunar caustic. If the teats appear hard and dry rub them with lanolin.

Mastitis.

I have a cow that frequently one quarter of her udder, and then another, will swell up, get hard and when it gets soft, that part will give thick, stringy milk. A. M. B.

Newell, Ia.

ANSWER

This is very often brought about by cows compelled to lie in a narrow and uncomfortable stall, thereby squeezing these quarters against the hoofs while laying down. Hot fomentations and plenty of hand rubbing are the quickest to relieve this trouble. Apply them as often and as long as possible. A little warm lard rubbed into the udder between the fomentations, will greatly aid to soften the parts. Be sure to first remove the cause.

Lame in Back.

My Chester white boar is about one year old, and about a month ago commenced to wabble in his hind parts. In a few days was down unable to rise with his hind parts, and at present does not try to use them in the least. I thought it

LANDS EASY TO GET

I have lands, all good farming land, in Wilkin and Polk counties, Minnesota and Grand Forks and Burleigh counties, North Dakota, that I will sell on crop payment plan, with small cash payment of from $2.50 to $3.50 an acre cash down. Must sell. A chance of a lifetime. Investigate. For description and how to reach them, address

E. E. SECOR, Buffalo Center, Iowa

FINE FARM OF 150 ACRES 20 miles from Milwaukee, running water, high state of cultivation, large orchard, good buildings. A bargain if taken at once.

ADAMS & GLOVER LAND CO.,

Herman Building, Milwaukee, Wis.

Wisconsin

offers unexcelled opportunities for those who want to stop paying rent and make money in agriculture, in the fruit or dairy industry, or in sheep raising. Along the lines of the

Chicago, Milwaukee & St. Paul Railway

in Northern Wisconsin are many tracts of land admirably adapted to the home-seeker. In former timber tracts are many cultivated farms worth $50 to $75 an acre. Adjoining them, enjoying the same advantages, are unimproved farms for $7 to $20 per acre. Why not take a trip there and investigate these openings for yourself?

Additional information on request.

F. A. MILLER, GENERAL PASSENGER AGENT, CHICAGO.

DO YOU WANT 10 COWS?

We make the following liberal offer to any reliable farmer who buys 160 acres of land of us: We will furnish you with 10 cows, either fresh or soon to become fresh. They cost you just the market price. You sell their cream to the creamery. Every month you have the Creamery Company send us sixty per cent. of the amount due you for cream. You do this until the cows are paid for. In one year the cows with their increase will pay for themselves. After the first year they will take care of the annual payments of principal and interest due on your farm. If you buy a half section, we will furnish you with 20 cows, and so on, selling you 10 cows for every 160 acres you buy. This is the "crop payment plan" applied to stock. We expect purchasers to pay from $2.00 to $3.00 per acre in cash—sometimes we make easier terms to good men. If our plan interests you, write us.

WHITNEY & WHEELOCK, 22 Broadway, Fargo, N. D.

ILLUSTRATION.

A NORTHERN MINNESOTA RASPBERRY PATCH

Very few of the better class of dairy farmers in the old settled districts of the United States appreciate the opportunities that are offered to the dairy farmer who is anxious to secure a better market, broader field, and higher prices than he secures at the point where he is located.

For this reason we wish to call to the attention of our readers the possibilities of the new markets opening up in the mining districts of Minnesota. This district contains two distinct iron ranges, about twenty-five miles apart, and extending across the northern portion of Lake and St. Louis counties, Minnesota. On these two iron ranges, especially on the southern range, known as the Missabe or "soft ore" range, are a number of towns of a population of all the way from two or three hundred to about seven thousand people, which are built up by people drawing good salaries or wages, or making good incomes, who are also a class of people ready to spend their money to get the best that the country offers.

These towns are located according to the mines, and are maintained by the mines and sawmills, and other lines of business, which are building up there.

The country south of this more southern range is especially adapted to stock and dairy farming and the raising of vegetables, feed grains, and fruit. It has already been proven one of the finest clover and timothy countries in the world. The early settlers, who have put in small crops of wheat, rye, oats and corn, have received very good returns from their small acreage. Potatoes grow tremendously, returning very large yields per acre of the finest quality. Cabbages and other vegetables that market readily grow equally well, and those who have been adventurous enough to plant apple trees are now reaping satisfactory returns. The drawback of the country seems to be the work of clearing as it appears to the new comer. This work is usually over-estimated and in this St. Louis county agricultural district are some lands which can be readily put under the plow, free from stone, or from the work of grubbing.

The prospective settler may question the life of the market, arguing that the mining and lumber business will soon die out. The lumber business, which plays but a small part in the maintenance of the country, may dwindle down in the course of fifteen or twenty years, but the mining companies have at the present time work planned ahead in the ore bodies which they have blocked out to last fifty years, and are making plans for handling this project accordingly. This should thoroughly satisfy the investigator of this country as to the long life of the markets promised. We understand that in this county railroad companies have for sale several hundred thousand acres of desirable agricultural lands which can be secured on extraordinarily easy terms by actual settlers, and that the speculator is discouraged by these railroad companies while the settler is encouraged in every way. We would advise our readers, who contemplate making a change, or the farm hands and hired men of our dairy farmers, who contemplate branching out for themselves, to thoroughly investigate this country,

Wise Man's Wagon.

The man who has had experience in running a wagon knows that it is the wheels that determine the life of the wagon itself. Our

ELECTRIC STEEL WHEELS

have given a new lease of life to thousands of old wagons. They can be had in any desired height and any width of tire up to 8 inches. With a set of these wheels you can in a few minutes have either a high or a low down wagon. The Electric Handy Wagon is made by skilled workmen, of best selected material—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs. Here is the wagon that will save money for you, as it lasts almost forever. Our catalog describing the uses of these wheels and wagons sent free. Write for it.
ELECTRIC WHEEL CO., BOX 130, QUINCY, ILLINOIS.

BUY A MILL

that grinds small grains, corn on cob, shelled corn, either or all mixed.

The New Holland

grinds in any form to desired fineness, runs easy, grinds fast and costs half what others do.

Sold on Free Trial Plan.

OREN ONEAL, M. D., Suite 904, 52 Dearborn St. Chicago

might be kidney worm, gave him a few doses of copperas, also turpentine. He eats as natural as ever. acts as healthy as ever, otherwise.
Hartland, Minn. W. W. B.

ANSWER.

Apply equal parts of oil of turpentine, ammonia and cotton seed oil over the back once daily, and rub it well for 5 or 10 minutes. Give the animal a teaspoonful of equal parts of sulphur and nitrate of potash twice daily.

Garget.

I have two cows which have lost one quarter each from garget. Will you kindly advise if the milk and cream from the remaining three teats is all right to use in my household? Also, is it probable that heifers from these cows will inherit this defect? L. DeS.
Bailey, Tenn.

ANSWER.

If the other quarters are healthy, and the ones which are dry, do not suppurate or discharge unhealthy fluids, the milk from the remaining quarters is fit to use for your family.

It is not probable that the heifers from these cows will inherit the defect.

Altered Secretion.

I have a Jersey cow that I think is somewhat affected with garget. Every few days one quarter of udder swells and gets somewhat hard and the next milking some white, cheese like milk or matter is milked out. Generally it is in pieces or stringy like. In udder or quarter there is sometimes a lump when swelled, but goes down in a day or two. D. S. S.
Mansfield, Ohio.

ANSWER.

Give a full dose of physic. When this has operated, give a dram of Potassium Iodide in a quart of water, an hour before feeding, morning and night; keep indoors until you notice a change for the better.

Obstructed Teat.

A valuable cow just dropped second calf, has one rear teat obstructed by something about the size of a No. 4 shot. Have to use a straw to pass milk. T. O. S.
Jamestown, R. I.

ANSWER.

Pass a good sized milking tube up into the teat, then locate the obstruction and squeeze it up and down against the tube for a few minutes, each time after milking. You may paint the region over the enlargement, twice a week, with tincture of iodine. Do this after milking.

Milk Fever.

Thoroughbred Holstein, three years old, could not calve alone, and upon examination found calf wrong end too, with hind legs under belly. Straightened the legs and removed calf, which was nearly dead. In twelve hours called the veterinarian who removed the afterbirth. Cow received one lb. salts, ginger, laudanum and bicarbonate of soda in doses that were ordered. Cow died in 22 hours. Symptoms were, refused to eat or drink, extremities cold, low pulse, limbs stiff, difficult breathing. Eyes became more and more sunken and glassy, head at the side, and not hardly any milk in the udder. I called it milk fever. How much hurt will it do if the Schmidt treatment is used on a cow that is suspected of having milk fever and did not have it?

Have a four-year-old that is very fat and a heavy milker (over 7,000 lbs. second season) that is due Oct. 1st. Will have the Schmidt treatment all ready in case of need. G. L. P.
Wilshfield, Ohio.

ANSWER.

We believe your cow had milk fever. The Schmidt treatment would have been your remedy. It does no harm to apply the Schmidt treatment to a cow even if she did not happen to have milk fever.

Horse Owners! Use
GOMBAULT'S

Caustic Balsam
A Safe Speedy and Positive Cure

DR. B. J. KENDALL CO., ENOSBURG FALLS, VT.

VETERINARY PIXINE CURES

Grease Heel, Scratches and Hoof Rot,—chronic, ulcerated, complicated—of the most deep seated character; Cracked or chapped teats, caked bag, cow pox and all inflammatory affections of the udder; Saddle and Collar Galls, Nipple Chafes, and Abscesses, Old chronic Sores, the result of pressure by badly fitting harness or by irritating masses of dirt, sweat and hair under the harness. It makes a positive and permanent cure by producing healthy granulations, building up new cellular tissues, healing naturally from the bottom without scab or scar and stimulating growth of hair, natural color. It penetrates, soothes and heals while horse works.
Absolutely Guaranteed. Money back if it fails.
2 oz. 25c; 8oz. 50c; 5lb. pkg. $4.00.
At all Dealers or sent prepaid.
Send 10c for sample box and booklet. Troy Chemical Co. TROY, N. Y.
VETERINARY PIXINE

"SAVE THE HORSE" SPAVIN CURE.

$5.00 WITH WRITTEN GUARENTEE.

It isn't words, type or page advertisements, it's the truths that ring out sound, clear and impressive—actual results from business men whose standing and reliability can be readily ascertained—which have made **"Save-the-Horse"** such a success. Their cured horses are living advertisements, absolute certainties as to the possibility in your own case: with every bottle is a guarantee document as binding to protect you as the best legal talent could make it.

The fire iron invariably only aggravates the disease or injury, blistering is less effective; both necessitate laying up horse four weeks to several months. Mercurial and poisonous compounds produce irreparable injury.

"Save-the-Horse" eliminates these factors; Cures without scar, blemish or loss of hair, can apply at any time, anywhere, in all conditions and extremes of weather. Horses may be worked as usual with boots, as no harm results from destruction of hair or scalding of limb.

Positively and Permanently Cures Bone and Bog Spavin, Thoroughpin, Ringbone (except low ring bone), **Curb, Splint, Capped Hock, Windpuff, Shoe Boil, weak and Sprained Tendons and all Lameness.**

$5.00 per Bottle with written guarantee, constructed solely to protect you. Need of second bottle almost improbable, except in rarest cases. Send for booklet and copy of guarantee. If case is different than described in booklet or advertising we advise frankly of the possibility of the remedy effecting cure. Give particulars, state age, development, location of swellings, lameness, and describe way horse carries leg.

$5.00 per bottle at all druggists and dealers, or sent express prepaid.

Providing a Silo for Next Year.

ED. HOARD'S DAIRYMAN:—There is a great deal of interest and a great inquiry and a great demand for silos this second week in September and yet the time is closely at hand for people to cut up their corn. You understand that this Company have been manufacturing silos for the last ten years and to-day we could use four times the machines we have, and four times the men connected with the silo department tnat we are now carrying and operating, but we haven't the room for them. It may be said that the up-to-date manufacturer should be able to take care of all the trade that is offered to him, but the silos vary in size. It is impossible for a manufacturer to build a lot of silos and store them as can be done with machines of various kinds. We have had a number of people come here to Kalamazoo in the last ten days who were satisfied that if they got a frost at the usual time of year, their corn crop was practically lost. They were ready to buy a silo now; the same conditions in regard to their corn crop existed a year ago and we had people come to us who said it was up to them to buy a silo and save all their corn crop or practically lose all of it from frost.

Your paper, as well as most of the farm papers, are urging the use of a silo in the last sixty days, four times as strong as you did during the winter months and yet we hold if a man is going to build a barn or a granary or any other improvement on his place, he will take it up in the winter months and possibly get ready to put it up and we hold that the time for a man to buy a silo is in the early winter or early spring months. The installation of a silo on a man's farm in April, enables him to get this work done and out of the way of his spring work and he has it ready for his clover crop if he wishes to put a portion of it in, or if the weather is such that he is apt to lose that from wet weather, and then he has it to feed out during the dry hot weeks of August and September.

We think you can serve your readers in the winter time by urging them to take up the placing of a silo at that time and while your excellent paper gives the rations of a great many dairymen, one of which would show that they were feeding ensilage, at the same time all of us are prone to defer making a purchase unless we are pretty near ready to use it. We assume that every concern manufacturing silos has more business than they can take care of at this time of year, at least that is our condition and there isn't one of them but what would make a concession to buyers in the early part of the year which they cannot afford to do at this season.

This company has erected for the American Jersey Cattle Club on the St. Louis Fair grounds, one of our 18x40 ft. Redwood silos and we have also put up a little smaller one for the Short-horn Association, and as there will be a great many people at the St. Louis Fair next year, there will be a good opportunity to examine what we consider the most durable material in the shape of lumber there is in existence. And right in connection with this high priced lumber as some term it, our experience in the silo trade shows that the buyers as a rule are buying larger silos and better material than they have before in eight or ten years, and we believe that you can serve the interests of your readers at all times by urging them to build a silo and build a good one, and build it early in the year.

You can publish our views as manufacturers, if you wish, and we would like to hear an expression from other manufacturers. WILLIAMS MFG. CO.

Kalamazoo, Mich.

Flax Seed for Fattening Veals.

ED. HOARD'S DAIRYMAN:—I noticed in your paper of Sept. 11, an item under head of "A Massachusetts Appeal." In regard to cotton seed meal, I have never fed any to calves, but know of parties that tried it, and they did well for a while and then they all died very suddenly.

I think if S. B. R. would get some whole flax seed and steep it up and strain, (perhaps ground flax seed scalded would do as well) and try it on one or two, it would fat inside and they cannot tell them outside from new milk calves. I have fattened a good many that way, but never dressed but one, and that showed large quantities inside.

Oxford, N. Y. J. D. V. R.

THE BUGLER'S CHEST

Is well expanded. He uses his lungs to their fullest capacity. People in ordinary do not use much over half their lung power. The unused lung surface becomes inert, and offers a prepared ground for the attack of the germs of consumption. There is no need to warn people of the danger of consumption, but warning is constantly needed not to neglect the first symptoms of diseased lungs.

Dr. Pierce's Golden Medical Discovery cures obstinate coughs, bronchitis, bleeding lungs, and other conditions which, if neglected or unskilfully treated, find a fatal termination in consumption. It is entirely free from opiates and narcotics.

"About three years ago I was taken with a bad cough, vomiting and spitting blood," writes Mr. D. J. Robinson, of Spring Garden, W. Va. I tried many remedies; nothing seemed to help me till I commenced using Dr. Pierce's Golden Medical Discovery. After using ten bottles and four vials of his 'Pleasant Pellets,' I commenced to improve. My case seemed to be almost a hopeless one. Doctors pronounced it ulcer of the lungs. I was sick nearly two years—part of the time bedfast. Was given up to die by all. I thought it would be impossible for me to live over night at one time. I haven't spit any blood now for more than twelve months, and worked on the farm all last summer. It was Dr. Pierce's medicines that cured me."

Accept no substitute for "Golden Medical Discovery." There is nothing "just as good" for diseases of the stomach.

The "Medical Adviser," in paper covers, is sent *free* on receipt of 21 one-cent stamps to pay for mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

SEND 50 CENTS to Modern Medicine Co., Dept. B., Benton Harbor, Mich., for their Wonderful Tonic Tablets, that restores health and vigor to men and pale, sickly women. Guaranteed or money returned. Valuable medicine book for 2 cent stamp.

Improved and Unimproved Farms for Sale

Farm No. 1 consists of 90 acres with frontage on a fine lake where there is excellent fishing and game. This lake is one of a chain of lakes on which you can travel for twenty-three miles. Has two-story house with eight rooms. Two-story log barn. Ice house and ten acres cleared. For sale at a bargain. One mile and a half from the railroad.

Farm No. 2. One-half mile from the railroad. 100 acres or more if desired, five acres cleared. Two-story, eight room house. Glass chicken house. First-class hog pen. Plenty of timber on land for own use, and quite a quantity of saw timber. We have besides this 16000 acres of unimproved land. Heavy black soil. All lies in Central Wisconsin. Low priced Excellent markets. Will grow any kind of crop and produce immense results. Excellent water supply. Splendid markets and a local demand for everything that is raised. None of the land lies more than three miles and a half from the railroad.

WISCONSIN FARMS

Will furnish names of people who have bought from us who have made big success. Can furnish lands in either small or large quantities. Can furnish reduced rates to see the lands. Easy terms to suit the convenience of the purchaser. As safe and desirable an investment as government bonds. Write in for maps and any information you may desire.

INTERIOR LAND CO., Janesville, Wis.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn, (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x2 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

21 STRONG REASONS

WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to own a low-priced farm than to owe for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agricultural districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.

WISCONSIN BLUE GRASS LAND CO., Baldwin, Wis.

DAIRY FARMING

AND FRUIT RAISING IN MINNESOTA

Very few people realize the opportunity for dairy farming and fruit raising in Aitkin and St. Louis counties, Minnesota. Railroad lands can be secured on very easy terms at reasonable prices, which can be easily put in shape for best class of dairy farms and fruit orchards.

The Duluth & Iron Range Railroad Company, and the Chicago, Rock Island & Pacific Railway Company offer special inducements to actual settlers, and particularly easy terms to renting farmers and hired men on farms who wish to get a start for themselves. Write for our book of Happy Homes in the Tall Timber, and do not hesitate because your funds are low to come and see what we can do toward helping you secure for yourself a happy and successful home in the fruit and dairy district of Aitkin and St. Louis counties.

Questions in Ventilation, Cow Stalls, and Concerning Beet Pulp.

ED. HOARD'S DAIRYMAN:—For a cow barn 28×42 with two rows of stalls, one for cows and one for calves with two box stalls on their side, a six foot feeding alley in center, would a ventilating shaft 2×3ft. made of dry flooring, either at one end outside, or in corner of a box stall, running up 30 ft., do for the outlet; and four intakes, one at each corner 8 in. square, built as you have so often explained, do for the fresh air? If not, please suggest a better way. I only know of the system through your writings for the last eight months and it seems just the thing.

In reading your article on the cleanliness of your cows during winter, I can not help wonder why, practically all writers are so silent on the actual construction of good, healthy, cleanly and comfortable cow stalls. Week after week we have silo construction, barn construction (outside of stalls,) and in fact everything pertaining to a cow's comfort and well being, except the place, the actual bedroom, of the cow, for practically six months out of twelve. I know a great many men are dissatisfied with stanchions. A very few want the patent double up concerns, and still, if the question is asked: "How shall I build my cow stalls?" the answer will be to refer to the advertising columns. This is not in one paper but all which I have the privilege to read. I wish a few articles could be written by different parties describing in detail their ideas along this line. I believe it would pay.

Do you care to pass judgment on the beet pulp molasses feed now advertised in your columns? B. E. M.

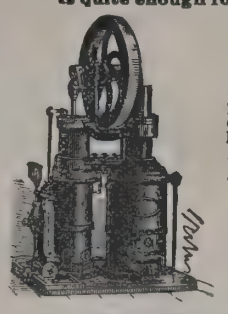
Mannington, W. Va.

Prof. King's rule for size of ventilating shaft is a cross-section of four square feet for each twenty animals. On this basis a shaft or flue 2×3 ft. would suffice for thirty grown cows, provided it is approximately thirty feet high and has no sharp bends to interfere with draft. The number and size of intakes cannot be so definitely estimated, because of the difficulty of ascertaining the amount of fresh air that will sift in around doors and windows and otherwise.

It is well to provide too many, and have them well distributed, rather than too few, as it is an easy matter to close those not needed, and variations in wind and weather necessarily require some adjustment. We would recommend not less than three of these intakes on each side, and four would be better, as they would give a more uniform distribution of the incoming fresh and cold air.

In the matter of stalls or "bed-rooms" for the cows, HOARD'S DAIRYMAN pleads not guilty to any suppression of anything that can throw light on the subject. It has published, on some three or four occasions, illustrations and descriptions of practically all the devices in use for this purpose, but it cannot be expected to republish such matter in response to every inquiry submitted, more especially as some of the best of these are regularly advertised in its columns, and it does not consider itself competent to pronounce any particular device superior to all the others.

It would be an admirable investment for B. E. M. and thousands of other farmers to purchase King's Physics of Agriculture, a book of some 600 pages, in which these problems of ventilation and cow stalls, as well as numberless other problems relating to farm buildings and farm economics are exhaustively discussed. The book costs only $1.75, and is sent from this office, postage prepaid on receipt of that sum.



We have a very high opinion of the feed referred to, but have had no occasion to make use of it in our own herds Why not send to the advertisers for the printed matter descriptive of this feed and its analysis, and then, if it seems to fit in with your home-grown feeds, make a trial of it.

Flavor

The market value of butter is unquestionably its flavor, and its flavor is unquestionably affected by the quality of the salt used. Prize winning butter makers always use DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—to insure that *winning flavor*. Its pure, dry flakes quickly dissolve—assimilate *evenly* through the butter, and add a keeping quality that is inestimable. No waste—no grit—no mottled effect. The only salt in the world that's all salt. Dairymen will find our illustrated booklet "Just Salt" contains valuable hints. We send it free.

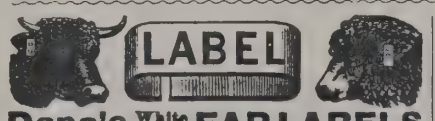
DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.



The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

WORCESTER SALT--IT USES NO OTHER

WILCOX & HARVEY MFG. CO.,
196 Lake St., Chicago, Ills.

WINCHESTER

'NEW RIVAL" BLACK POWDER SHELLS.

It's the thoroughly modern and scientific system of loading and the use of only the best materials which make Winchester Factory Loaded "New Rival" Shells give better pattern, penetration and more uniform results generally than any other shells. The special paper and the Winchester patent corrugated head used in making "New Rival" shells give them strength to withstand reloading.

BE SURE TO GET WINCHESTER MAKE OF SHELLS.

CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

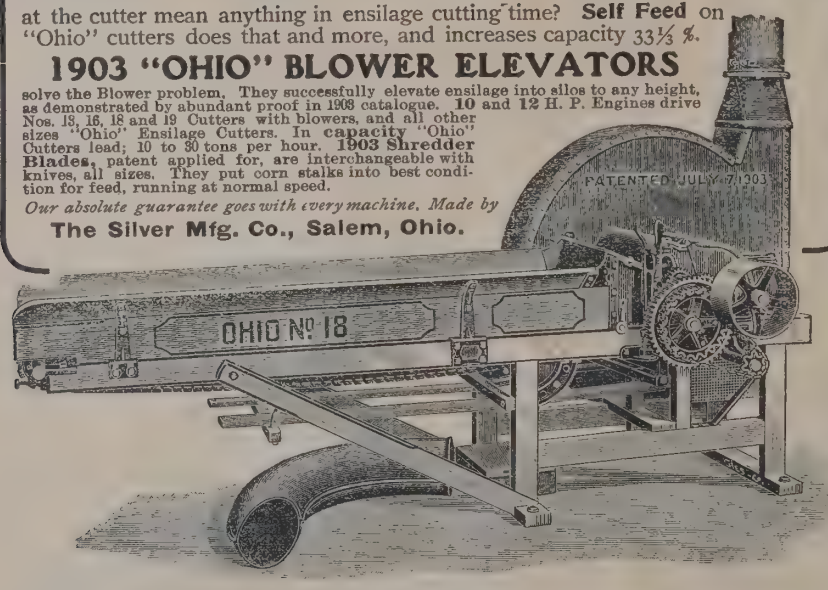
CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

Does Saving **ONE or TWO MEN**



at the cutter mean anything in ensilage cutting time? **Self Feed** on "Ohio" cutters does that and more, and increases capacity 33⅓ %.

1903 "OHIO" BLOWER ELEVATORS

solve the Blower problem. They successfully elevate ensilage into silos to any height, as demonstrated by abundant proof in 1903 catalogue. **10** and **12** H. P. Engines drive Nos. 13, 16, 18 and 19 Cutters with blowers, and all other sizes "Ohio" Ensilage Cutters. In **capacity** "Ohio" Cutters lead; 10 to 30 tons per hour. **1903 Shredder Blades,** patent applied for, are interchangeable with knives, all sizes. They put corn stalks into best condition for feed, running at normal speed.

Our absolute guarantee goes with every machine. Made by

The Silver Mfg. Co., Salem, Ohio.

WE GUARANTEE that under the same conditions as to power and speed applied, condition of corn, etc.,

The Appleton Corn Husker

will do more and better work than any other machine of like character and corresponding size on the market; that it is simpler in construction; easier in every way to operate; easier and safer to feed and to require less power for successful operation. The proof of these claims is sent for the asking. We make also a complete line of sweep and tread horse powers, shellers, ensilage and fodder cutters, feed grinders, wood saws, windmills, etc. **Remember that Appleton quality is the standard of excellence.**

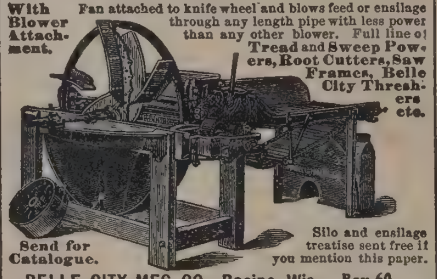
2-Roll, 4-Roll, and 6-Roll, Down or Mounted.

Write to-day for free Catalogue.

APPLETON MFG. CO., 35 Fargo St., Batavia, Ills.

MILK TUBES Patent Coin Silver 1¾" 50c. 2⅜" 80c. Improved Teat Opener 75c. Dilating plug 25c. Postpaid on receipt of price. **G. P Pilling & Son,** 2d and Arch Sts., Phila., Pa.

WRINGING WET Clothes dry is the reason for using any wringer. Saving clothes, buttons and money is the reason for using **Horse-Shoe Brand Wringers.** They are made with rolls of the finest Para Rubber. Every wringer is warranted. **THE AMERICAN WRINGER CO., 99 Chambers Street, New York.**



Ensilage Cutters "They Throw and Blow." Pneumatic. "Silo Fillers." **Blowers.**

These machines cut and elevate with the same wheel at the same time. This wheel has paddles which throw and fans which blow. Without the fans the paddles would throw the ensilage 15 feet high. A light blast of air in addition will blow it to any height. No chains, belts or cogs to slip and waste power. A two-horse tread power will cut and elevate 4 tons per hour, a 10 h. p. engine 20 tons per hour. The easiest running and safest cutters and blowers made. Also cutters and carriers, shredders, silos, engines, horse powers, saw machines, etc. Send for catalogues.

HARDER MFG. CO., COBLESKILL, N.Y.

BELLE CITY Feed and Ensilage Cutter

With Blower Attachment. Fan attached to knife wheel and blows feed or ensilage through any length pipe with less power than any other blower. Full line of **Tread and Sweep Powers, Root Cutters, Saw Frames, Belle City Threshers etc.**

Send for Catalogue. Silo and ensilage treatise sent free if you mention this paper.

ARE THERE COWS ON MARS?

Nobody knows. But **everybody** knows that dairymen need a separator that gets the cream—gets it all—gets it quickly—gets it easily—gets it cheaply. Dairymen, the world over, are turning from the contraption filled, top heavy, back breaking, hard to clean, bucket-bowl separators to the Dairy Tubular Separators.

TUBULAR HAND SEPARATORS

Are as modern and different from all others as all others are antiquated and alike. The Tubular bowl is hung from a simple ball bearing—runs smoothly, doesn't vibrate, can't bind. It contains one tiny piece, and that removable, and can be thoroughly washed in three minutes. It has a bottom feed thus preventing the mixing of whole and partly skimmed milk—makes clean skimming quick. The low supply can is easy to fill—a six-year-old child can look into it. It saves the back. The enclosed gears, running in a mist of oil save power, avoid waste, prevent accidents.

Our free catalog tells all about the Tubular. A postal card will bring it and may save you money, work, and worry. Ask for No. 144.

A Live Dairy Association.

ED. HOARD'S DAIRYMAN:—It was recently my pleasure to attend the annual meeting of the Milk Producers' Protective Association, of Westmoreland County, Pa, and address it on the subject of dairying and other things relating thereto. The meeting was not large but it was earnest, and the exercises were made to conform to the size of the attendance. The association numbers about one-hundred and twenty-five members, who all share in the good results the organization has been able to secure, although the regulation complaint arises from the wheel-horses, as from all such bodies, that a few must do the work. I do not think this as a rule indicates any lack of interest on the part of other members of the team, but is more generally an unspoken confidence that the leaders are doing all that may be done.

The pioneer work must always be undertaken by those naturally endowed with the rare qualities of leadership. There must always be hewers of wood and drawers of water, with many quiescent ones to accept all benefits and sometimes find fault.

This association is composed of milk shippers, and by reason of its representative strength, has been able to regulate steady and remunerative prices for milk, as well as command the attention of the mediums of transportation.

The meeting was much interested in the questions of the better cow, her best care and her most economical feeding, her breeding and her tribe. The silo, ensilage, alfalfa and kindred subjects have lost no interest for these business dairymen, and he needs must be posted who goes to talk to them.

THE SPECIAL BREEDS.

My tentative suggestion that these people might find in some of the larger milking strains, animals for mere milk production more profitable than the breeds of more concentrated purposes, was not well taken, one of the most prominent and successful members assuring me that his good Jerseys stood second to none within his knowledge in the production of quantity, and had the further desirable recommendation of commanding from one to two cents more per gallon than milk of inferior quality.

True, there is a one-time cheese maker from the lumber regions of Pennsylvania, who is sent around to farmers' institutes assuring the people that butter fat in milk is a substance of no nutritive value and should not be striven for by producers of milk. But this Martinesque theory has not yet found its way among the enlightened citizens of the state who are still willing to pay the best price for the milk that makes cream.

For instance, my friend Shoemaker, who owns a fine farm and a profitable herd of registered Jerseys, near Greensburg, Westmoreland county, sells all the Jersey milk his large herd produces for a yearly price of eight cents a quart, which circumstance can scarcely be attributed to the extravagant tastes or bad judgment of his satisfied customers.

A FAVORED SECTION.

The farmers in this western section of the state are highly favored. They have in their cities, and almost countless towns, an unequaled market for all farm produce—"anything sells."

Their markets are near at hand. The subterreanean value of many of their farms far exceeds the surface value, and the land's worth for farming is not lessened by the fact that deeper down it has a market value often of four or five times as much, for the digging of coal. Indeed, in some sections there are oil and gas in addition to the coal.

FEEDING QUESTIONS.

Dairymen, with excellent markets, do not always consider the question of the cost of feeds with the minuteness that less favorable circumstances make imperative with others. Where this care in feed cost is forced upon us the saving of a few cents per day commands our keenest thought, and necessity becomes the mother of reform. I tried to impress upon these friends (many of them regard HOARD'S DAIRYMAN as a dairy essential—and that means any amount of dairy grace) that they could not afford to feed forty to fifty-cent oats and twenty-or-more-dollar timothy hay to cows, but they simply point to their profits and discount the prophet.

Pennsylvania. W. F. MCSPARRAN.

Castile soap is supposed to be made of olive oil, hence its presumed purity. Some Castile soap is made of olive oil and some is not. Some Castile soap is good and some is bad. In purchasing you can not tell which kind you are getting.

In buying Ivory Soap you are always getting a vegetable oil soap of known purity. It is also more attractive in form, lathers more freely and is therefore more convenient to use

The Dairy Cow.

[By Mrs. Minnie Eshelman Sherman at the University Farmers' Institute at Long Beach, Cal.

Scientific dairying, as to the feeding of the cow and the handling of her product, has been the outgrowth of the specialized work of the dairy school experts. While the creamery man, with his manner of paying as little as possible for what the cows produce, has made the dairyman take out his pencil and learn to figure just exactly what the cows do earn, so he has, by calculating, brought the keeping of the cows down to a business basis.

HISTORICAL.

The first historical mention we have of the importation of cattle is that they were brought by the Europeans to Mexico about the year 1525. The mild, equable climate and the abundant, grass-covered ranges caused them to multiply rapidly, and they soon covered not only the plains of Mexico, but those of Texas and California, with their offspring.

The first improved cattle came to Virginia from Holland in 1625, and were of beef and milk form. The oxen were powerful animals, plowing the new lands, while the cows furnished a small amount of milk for the settler's family. The first cows used solely for milk were brought from Normandy to Quebec by the French emigrants. It is said that these yellow, dun and silver gray Normandy animals enter largely into the foundation strains of both the modern Island Jersey and Swiss cattle. They were of medium size and gave a fair quantity of milk, while the oxen were large enough for plowing in a hilly country, like Canada and New England.

However, the dairy cow was, as yet, of little value in the eyes of the farmer, for as late as 1825, at a Massachusetts county fair there was no class for cows or for butter or cheese; but there was the surprising entry of 100 yoke of oxen competing in feats of strength and docility. I wonder if there were some old men there to croak at that county fair as an ox show, just as we croak today that our fairs are mere race horse matinees.

The beef strain is very hard to breed away from; even in the fifth and sixth generations of cows it often crops out when cows are fed for heavy milk production. Many a good grade cow has slipped off into beef when five or six years old, causing a loss—for it does not pay to fatten a beef on dairy rations. When we consider a good cow should produce 350 pounds of butter, worth, say 25 cents a pound, or $87.50 in a year, it is, indeed, killing the goose that lays the golden egg to sell her for cow beef at $30 to $40. You see we do not believe in the general-purpose cow, though it may seem presumptious, for she has prominent advocates; but then, "seeing is believing," and we have never seen one.

DAIRY POINTS.

Now, in selecting a cow for dairy use, one of the principal points is the stomach; it should be large and somewhat pendant—never set flush with the back bone, but always leaving a ridge. The stomach should suggest that the digestion is ample, and that the consumption of food can be pushed heavily, and yet a margin of reserve force remain, for the drain from the heavy milk flow should be urgent and her appetite constant if she is to continue in profitable milking for the entire year.

Draw an imaginary line directly across the cow's body in front of her udder. First of all, notice if ample breeding power is indicated by the width of her pelvis. The hips should be high, the thighs wide and incurving well; a strong; rugged back bone, with a distinct rise at the rear, so as to make the animal taller at the rump than at the shoulder. This rise should be gradual, and in improved breeds is rarely a rough, disfiguring hump. The tail should be long and slender and set high enough to carry out the high line of the pelvic arch. She should be thick through in front of the line to give ample room for heart and lungs, with a large navel and well developed milk veins, with a skin soft and full of oil. The head and neck should be fine and feminine, the breast without brisket or dewlap: the eye clear, prominent and full of gentle intelligence, while the under jaw should be strong and rather short. The spare hind quarters of the dairy cow have grown lighter and lighter in the years past.

THE UDDER.

The teats should be well placed and of convenient size and shape, neither too large nor too small, and far enough apart to be easily milked dry. The two small rudimentary teats behind the four regular ones are a good indication for milk continuance in a cow. The Swiss say that they indicate a cow will transmit her quality as a milker to her offspring.

The elaboration of milk by the cow is a physiological mystery about which little is definitely known. The alliance between blood supply and the milk shows, however, that to have a copious supply of milk, there must be a correspondingly generous supply of blood. The blood flows from the heart to the udder, and passes into the milk veins, and back through the milk walls, near the fore legs into the body, returning again to the heart and lungs. The milk veins show by their size and engorged condition the amount of blood they carry. The milk wells should be large enough to admit easily the second finger of a man's hand.

The front part of a cow's udder is often less well developed than the rear portion. Here is a loss in milk greater than is commonly recognized. Some years ago Professor Plumb found in thirteen cows deficient in the fore part of their udders, that the hind teats gave 57% more milk than the front ones.

OLD ONES.

As to how long a cow should be retained in the herd each must decide for himself; but I am satisfied that many people sacrifice their cows by selling too soon, as they are afraid the cow will become too old for the butcher. I have kept many cows until they were worthless for beef and thought that it paid better than to lose a year or two of good milk. The mature cow has outgrown the likelihood of milk fever and garget, and has shown she possesses good lungs and a good digestion and that her disposition is good. We have had cows eighteen years old that made 350 pounds of butter in a year. By the records of 486 cows kept for seven years, the age of greatest profit in a cow's life is from six and a half to fourteen years old. The Holland Government tested a large number of cows to find at what period of cow's life the milk contained the greatest amount of butter fat. The period was fixed as from the seventh to the eighth year, and that in a healthy, well-fed cow the milk capacity increased up to the twelfth year, the flow remained stationary until the fifteenth year, when it usually decreased until the cow became farrow.

SIRES.

The selection of a pure bred sire to head a grade here is wise. This sire should be a good individual, strong in his race type, with a backbone as rugged as the ridge of a continent, without brisket or dewlap; a distinctly masculine head, with a good, mellow skin. He should show rudimentary teats and dairy form in his rear conformation. It is important, though often overlooked, that the dam of this sire should have a perfectly formed udder—the form of the udder is strongly transmittable, and each breed has a type of its own. The sire should have a lively sense of his own importance, and not be willing to be imposed on by rough handling. He should fight if cornered, for the gentle bull rarely imparts grit to the offspring and endurance seems to be founded in temper. Listless, flabby people are amiable; so is a listless, inert bull. The very word, bully, should indicate his character; he should be ready to bluster and fuss at any infringements of the rights of his harem. It is better for the head of a grade herd to be a strong, typical individual than one whose dam is a phenomenal, record-breaking cow. There are many fine bulls sacrificed to the idea that nature will permit sudden great elevations of quality. Now, quality must be backed by the physical health of the animal; so, if we push quality before conformation, or correct form has been built up strongly, we are apt to lose health. Milk production is a heavy strain, and the animal must not only be physically educated herself to stand it, but must have inherited the acquired constitution from her dams.

Each sire used in breeding the herd should be more refined in type than his predecessor. We believe in each generation having fresh blood introduced, and do not believe in incestuous inbreeding.

This dairy barn, fine milk house costing $1,000 and good farm of 186 acres, have been paid for from sale of milk.

Oregon Experiences.

Ed. Hoard's Dairyman:—As I have been a reader of your very valuable paper for a short time (year and a half), it may seem that I am presuming too much to say what I think of various subjects treated in its columns, and also possibly lacking somewhat in dairy experience, since I date my begining in dairy knowledge from about that space of time.

Have had "right smart" to do with cows for near half of a century, but as to dairying as it should be done, can't say as I fully grasp the subject yet, but I believe I am learning.

There is too much against me to go at it as systematically as I should like, as I will explain farther on, but let me say that your crusade in favor of clean methods, is to my my mind very necessary, and should be encouraged by every one producing butter or milk for market. It does seem as though a man could see an inch beyond his nose, and see that cleanliness enhances his product and gives him a sure and stable market. It is no difference whether he sells cream to the creamery or sells his butter to the consumer, dirty methods lower the quality and the creamery man cannot renovate the cream as you would old feathers. But the dirty patron lowers the value of the whole batch of butter in proportion to the amount he supplies, and the butter is scored down instead of up, as it should be, to the highest quality.

I am dealing direct with the consumer, and as this summer is the first attempt in that direction, I think I am doing well to sell at 40 cents cash per roll, while others sell for 35 cents in trade at the country store. I was offered 50 cents cash for just a part, but I could not do that as it would cause me to sell the rest to the store. So I took 40 this year.

There are many sources that I am indebted to for information and the Dairyman is not the least. I read an article in your paper this summer on ropy milk; well, that very week I had a batch one morning, and by the aid of that article I located the cause, and I have not had any more trouble. I used to bring my cows in off the commons with a dog. I have learned better sometime since, much to my own satisfaction and profit, which has appreciated several fold.

I began several years ago with Shorthorns. I have only two left now out of nine, and they stay till I know I can do better. Have learned by observation and test that they won't do me. Have some full blood Jersey heifers and sire, now; am beginning all over. I tell you a farm separator and good dairy literature are eye openers in the way of education

along dairy lines. Then there is the subject of feed, the biggest item of all with me. To begin with, my place is seeded to mesquite (velvet) grass, as it is a stayer where all others fail amongst logs and stumps, but as a dairy proposition, it is a snare and delusion. So I sowed vetch, and vetch and oats this year and filled an 8x20 silo with the whole vetch for a trial; filled half full with cut corn last fall, and some of it was too ripe and the pressure was not great enough and did not get water enough on it so had a ring of white mould about 6 inches wide, 6 inches from the staves, clear around and up and down from top to bottom. This year am hoping for better results, as I put in the vetch green and filled it full.

When I built my cow barn I built a shed extension to cover the manure which I threw out of holes behind the cows. The law was passed since then in this state, prohibiting the dumping of manure within 150 feet from the barn where cows are stabled for dairy purposes Well, I got a scoop wheelbarrow and wheel the manure out in my orchard every morning and I whitewashed the inside of the stable where it was dirty, and I am going to build a shed half way between horse and cow barns to put manure in from both places. I know many of your readers will say it won't pay, and a year ago I would probably have said so too, but today I think it will pay the best in the world. I am not ashamed to let anyone, even the customer that buys my butter, see my cow barn. Besides I am getting "cranky" about my eating in my old age (or middle age) and as I eat some of the product of those cows I have got to thinking it just as well to be clean. That manure shed will when floored make a fine calf shed. See ?

A year ago I said that a balanced ration was out of the question with me. Only rich men could afford it. I couldn't. Well, I have been experimenting a little this year with some of my cows with oil meal and bran and that when pasture was at its best, and then I suddenly got out of both and went to feeding green vetch and oats, second crop, when I cut my vetch for silage. Well, the cows slacked up all right, so now I am in a study how far I can go with bran at a cent a pound and oil meal at a cent and a half or two cents, to go with oat hay and vetch silage next winter.

Another thing. My cows always freshened in spring, say May or June. Since I have begun to milk without a calf around, the cows have gone backwards; that is, they are freshening earlier each year till they will be fresh (7 of them) the last of January and the first of February One will freshen this fall.

I am sowing clover, both white and red, among the stumps and logs and it is taking well. I am a new beginner in the mountains where everything was covered with brush and timber ten years ago, but have 100 acres fenced and into grass, but have only 4½ acres under the plow. Have by the aid of another man cut from 18 to 30 tons of mesquite hay with a scythe, around amongst the logs and stumps, for this makes the fourth year. (Don't infer from this that everybody does so out here, for that is not the case. There are some very fine farms here that have been farmed for 40 years or more and have abundance of feed). Well, that may be dairying with a vengeance, but I am making a living at it where scores of others failed that put in their time at lumbering; and by the way, I had to do some work in the lumber camp till I got started, but I could see more in a cow than they did. Well, there are lots of other things I could write about as to yield per cow, experimenting with them with feeds, but they are like the experience of many of your writers, so I will close for this time by wishing you *bon voyage* in your undertaking to enlighten the average cow keeper like myself.

Holly, Ore. J. R. SPRINGER.

Health and Happiness in the Country.

The *Saturday Evening Post*, that great metropolitan weekly paper founded by by Franklin and published for nearly two hundred years, under the heading, "Back to the Tall Grass," prints the following relative to the drifting of the city folks to the free and open country:

"The cities are growing more and more crowded every year as people are attracted to them from the country, and year by year men are learning better and better the truth, that it is in the country that one can live the sanest life.

"Thus we can account for the remarkable exodus of city people to the country, and the tremendous influx of country people to the city. Brooklyn, for instance, was never so populous as now, and there are whole Jersey suburbs made up to the last man of people who have fled from Brooklyn and its confinements to breathe the fresh air of the Oranges.

"It is easy to understand why this is so. The city holds out inducements to to the country boy that his own environment will never yield him, and he comes to the metropolis, works at his business as few city boys can work, and in course of time he marries a girl who has also come in from the country to earn her living, and they settle down in a cozy flat up in Harlem or out in Brooklyn, and when his means at last permit, he builds himself a house on Rriverside Drive or the Park Slope and is happy. His children have all the advantages of the city that were denied him when he was a small boy, and if they do not grow up to as lusty a madhood as his, if they do not amount to as much as he did, there are two reasons for it; they have a rich father and he did not; they were born in the city. Now, it is an undeniable fact that few city men rise high in the councils of the nation. If a great man is wise he is born in the country.

"Yes, it is easy to understand why there has been such an exodus to the country. The city boy, born and brought up in a brick-walled dwelling, getting a a smell of the life-giving country air only during an all too short vacation, envies his country cousin who can breathe ozone all the year round and who has all outdoors for his playground, and he determines to go to the country to live if ever it becomes possible. To be sure he is only a clerk and promotion is likely to stop when he has reached a certain point, but perhaps he can get an ideal little house not too far from the city and lead there an ideal life—and perhaps an ideal girl.

"In course of time he meets and marries the latter, also a city denizen but with longings for the country. For the first months, or perhaps years, they must put up with a cramped city flat, although her father owns his house in the vicinity of Washington Square. But in course of time children come to them and then they see the absurdity, the criminality of bringing up children in the city. They remember their own childhood and how physically dwarfing it was, and they go a-house-hunting in the suburbs and at last find a cozy little house, not so far from New York but that he can commute, and they move out there, and he raises his own vegetables and she goes in for chickens and becomes something of a botanist, and her sons grow up lusty and broad minded.

"And the end of it all is that when the sons are of age to take up business they go into the city with a country education, and they take the prizes from under the very noses of the city bred children whose country bred father won the prizes of his generation before, and so the city and the country are changing inhabitants all the time and who shall say that it is not for the best?

But he is wisest who, having fled from the city as soon as he was able, keeps his children in the country, there to live and die. If every one lived in the country, the city would be a very good place in which to live because there would be plenty of room. Pending that time it were better for all city people to live in the country, for there is always lots of room there."

Commenting on the above, *Farm Life* says:

"The editor does not put it too strongly when he says that 'few city men rise high in the councils of the nation.' It is a blessed thing to be born in the country. While always contending that as a rule boys should stick to the farm, we do not wish to be understood as decrying the ambitious country youth who seems by nature to be fitted for some special and important work not found within the realm of farm and country life. The cities of today really owe their great growth and development to the brains of the country folks who in youth breathed the rich ozone of the farm, and reveled in the wholesome, free and out-of-door existence enjoyed by farmers alone.

Notice the conclusion of the article: "If every one lived in the country the city would be a very good place in which to live, because there would be plenty of room." In order to grow up to be great and distinguished men, boys must have plenty of room to expand physically and mentally. There will always be plenty of room for such growth in the country, and this being true, is it any wonder that the tide is turning toward that wide and open sea of health and wealth—the country?"

A Skin Game.

Nine farmers out of ten run their dairy herds on the lottery principle. It differs from the regular nickel-in-the-slot-lottery in that it deals with dollars instead of cents and that if the game is run long enough and on a large enough scale the chances are that the fellow who plays it will lose out. A farmer goes to the city and sees a young man drop a dime in a slot, turn a handle and get five cents in return. He calls the youngster a fool. Then he goes home and during the next year he shoves $40 worth of good alfalfa and milling-trust bran into Old Brindle and gets $30 in return. Of course,he does not call himself any names, because he keeps no count either of the feed Brindle eats or of the returns she gives. He can not be expected to blame himself with a loss that he knows nothing about. He knows that he paid off $500 on the new forty and supposes that Brindle did her share. She certainly did so, but if she had not done it her owner would have been $10 ahead The moral rests in the fact that most men who operate dairies, do not know what it costs to produce a gallon of milk.—*Denver Field and Farm.*

Keeping Cows Clean In Stable.

ED. HOARD'S DAIRYMAN:—In your issue of Sept. 4th, in an article headed "Keeping Cows Clean" you described the condition of cows in the stables of the Senior Editor.

Would be pleased to learn through your paper just what methods are followed to secure such results, and of these methods which are the most essential.

Also in feeding peas to hogs is there any advantage in soaking peas and feeding in troughs, over scattering peas on a feeding floor or the ground. B. J. P.

Moores Junctfon, Mich.

The system of stabling in use in barn of Senior Editor is what is known as the "Model Stall" which has been frequently illustrated in the columns of HOARD'S DAIRYMAN. We do not know that it is in any sense superior to other modern methods of tying cows, but all these methods are vastly superior to the stanchion plan both in cleanliness and comfort for the cow; and whatever promotes cleanliness and comfort in the cow promotes the profit of the owner.

It pays well to soak peas as well as old corn when fed to hogs. It costs nothing but a little effort and the peas and corn are thereby made more digestible. When fed it is best to place them in a clean place, whether that place is a trough or a feeding floor.

Crude Petroleum for Painting Silo.

ED. HOARD'S DAIRYMAN:—Tell those who want a paint for inside of silo to get a barrel of crude oil and put it on, all the boards will take. No danger from matches. In six or seven years repeat, and your silo will last many years. Have oiled mine three times in 16 years. B.

Opinions on Farm Life.

ED. HOARD'S DAIRYMAN:—As you ask your readers to give their opinion concerning H. C. R's. article, I take the opportunity to say a few words on a subject in which I am deeply interested and think every other farmer and dairyman ought to be.

It is true that class pride and class spirit lacking to a very perceptible degree amongst farmers as a class, and that farm work above all other kinds of work is held far below the dignity of man. The reason for this comes partly, if not wholly, from the fact that they have not had a chance to view the far more cumbersome labor of the city.

Take as a few examples, the common laborer in the city standing in a narrow trench from twelve to fourteen feet in depth, shoveling out dirt in order to lay sewer pipe. In the manufacturing plants of our machine factories, men are engaged amidst the whir and buzz of machinery in air made hot by the heat of many furnaces and polluted by odors too many to describe. These are all honorable avocations, but do they equal agriculture? Do they give a man as much rest of mind and body as to be engaged where you can breathe pure air and get a view of the broad expanse of country, and feel, as you ought, that you are a part of nature itself. Shame is more the product of idleness than of work. Work, when not excessive, tends to ennoble and uplift man, while idleness breeds in humanity a desire for sensation.

Our New York friend cannot have noticed the trend of the times, or if he has noticed it, he intentionally does not admit it, that farmers are commanding more respect from their fellow men than they have in the past, because more of them respect themselves. They have gained this respect through our agricultural press (papers like HOARD'S DAIRYMAN and others) and our agricultural colleges.

From these sources of knowledge farmers learn to know that their vocation can be made pleasant as well as profitable to themselves. If parents would but teach their children that all the arts and sciences come into play more or less upon the farm and that no work, as long as that work is honorable, is degrading, they would teach them a lesson that in their after lives they would bless them for.

Therefore, H. C. R. and others, education and the power of knowledge must open the way for a better understanding between the farmer and his business, and the farmer and men of other professions.

The dawn of this day is here, and the noble work is going on under the guidance of the most able teachers the world has ever known. P. A. P.

Hudson, Wis.

ED. HOARD'S DAIRYMAN:—I note an article signed by H. C. R., Oneida, N. Y., in yours of Sept. 18.

H. C. R. goes on to say that "you," HOARD'S DAIRYMAN, are figuring on the American farmer in a wrong direction. Most of the farmers, dairy farmers as well as the rest, despise their business. Their wives despise it; the daughters despise it, and the sons despise it. What can the farmer do but despise it? He hopes his sons and daughters will not have to work as hard as he has had to." The article winds up by asking: What do our readers think of the above?

I want to answer that not only as a professional man, but as one who has farmed it for ten years.

I think the gentleman writing that article does not know the trials of other avocations. Muscular tire is not the only tire; it is the least real tire. Who is more independent than a farmer? Who is more sure of a good, comfortable living? Who is more free from brain tire than the farmer?

Of late years such papers as HOARD'S DAIRYMAN are doing much to bring about a higher ideal, a higher standard in farming? Where is there an industry that has been more poorly conducted, slackly handled? Where is there better opportunity for advance than in farming? There are coming to the front now advanced ideas regarding not only the chemistry of soils, but feeding to bring results desired. All this is the result of study.

Where a man can take a farm that has carried 25 cows and make it produce enough to carry 75 cows, he is not only a silent teacher of our neighborhood about, but is bringing in more money into his own pocket.

I fear the brother farmer who wrote that, does not appreciate his vocation. I would have him change his thoughts. What is more more noble than the man who can make two blades of grass grow where there formerly grew but one?

The farmer is one of the most independent men on earth, but they do not sometimes know it. T. R. W.

Vermont.

ED. HOARD'S DAIRYMAN:—I was much surprised to day by reading the letter of H. C. R. in the issue of Sept. 18, page 717. Now we have a great many men in our community, who have worked on a farm and run a dairy for the past forty or fifty years and their sons after them, who would not change places with any retired lazy man in the county.

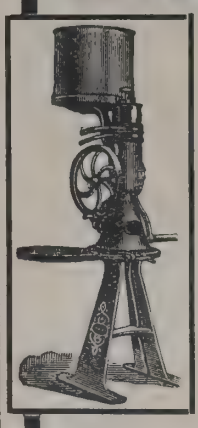
Of course we have a great many of the brand of men he speaks of, but by close observation, I find that nearly all of them are the men that are keeping the Star Boarder brand of cows and don't know a balanced ration from a Babcock tester.

And I do think that if every dairyman would make an effort and provide himself with a dairy of No. 1, thoroughbred cows, of some good milking breed, and try to improve them by breeding, feeding and reading, there would be a great many more farmers that would be well satisfied with their calling.

WILLIAM HERBERT.

Mantua, O.

Can the Percentage of Fat in Milk be Lowered by Scanty Feeding.



In the case of short periods (ten days to three weeks) the results of the experiments seem to be entirely consistent with the conclusion that scant feeding or the feeding of unbalanced rations exerts an entirely insignificant influence on the fat content of milk. The results of all these experiments which have come to my notice are summed up in the following conclusions of one such test:

The animals are fed for two weeks on rations which were insufficient. The cows lost in weight, and in some cases there was a slight shrinkage in yield of milk, but the composition remained practically unchanged, indicating that it is the flesh of the animals that first declines when the aliment is insufficient.

In the case of long continued, scantily, and poorly balanced feeding, it seems to be clearly established that the fat content of the milk may be materially reduced below the normal. This is illustrated by observation upon cows in Norrland. During the period from January to May, Norrland cows are in general fed only a meager allowance of marsh hay, and are therefore in a very poor condition when turned out to pasture in June. The results of about 2,000 analyses for these periods of feeding show that on rich pasturage their milk carried from 2.65 to 5.8 per cent, with an average of 4 per cent, of butter fat, and that on scant stable feeding the milk carried from 1.10 to 4.6 per cent, with an average of 3.25 per cent of butter fat. In discussing these results, the author concludes that the fat content of milk can not be increased at will by increasing a normal ration, but, on the other hand, that it can be greatly decreased by scant and poor rations. If a change is made from a deficient to a normal ration, the fat content of the milk will again be raised to the limit determined by the inherent qualities of the individual cow. This point is more or less generally accepted and is of practical importance in the case of ordinary feeding only, as it indicates that cows may be below their normal for some reasons, and that a proper ration may apparently increase the percentage of fat, when in reality it is only bringing the animals up to their normal quality of milk.—*Report Bureau of Animal Industry, 1902.*

IN THE PAST THREE YEARS THE ACTUAL WEEKLY SALES OF THE

EMPIRE Cream Separator

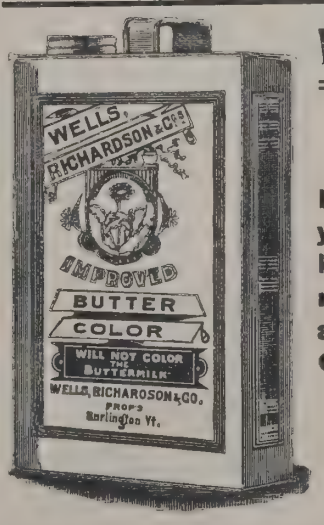
HAVE INCREASED MORE THAN 1000 PER CENT....

In other words, we are selling more than **ten times as many** separators as we sold three years ago.
And the demand still increases.
Not strange. Every EMPIRE sold in a neighborhood sells a dozen more. It's the kind the separator folks like.
Our book tells why.
Don't buy a separator on anybody's "say so." Investigate for yourself.

EMPIRE CREAM SEPARATOR CO.,
BLOOMFIELD, N. J. CHICAGO, ILLINOIS.

The Butter's Own Flavor

is all that's wanted in butter. Whatever it absorbs from outside detracts from its good quality. It is a question of wrapping. The ideal protector, whether for print wrapping, tub circles or tub and box linings, is



Pioneer Brand Parchment Paper

It holds perfectly the delicate butter flavors and keeps out contaminating odors. Pure vegetable parchment without taste or smell. There's a difference in parchments—one vegetable, some not vegetable, some so-called parchments. Don't get mixed on the brand—**It's the Pioneer.** Write us for sample sheets and book, **"Better Butter."**

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

A GOOD BARN YARD.

One of the most desirable adjuncts to a good dairy farm, and at the same time the hardest to get is a good, hard barnyard that will not poach up by the constant treading of the cows in wet weather. At the Hoard's Dairyman farm we have succeeded in constructing just such a yard, and that too in a comparatively inexpensive manner. The soil underlying the yard wherein run about 50 cows and heifers, is a heavy clay. Anyone of experience knows what that sort of soil means in a wet time. Into this yard three years ago we drew three car loads of coal cinders and it was soon as hard as a macadamized road, and has so continued to this day. It is easily scraped by the use of a two-horse barnyard scraper, and there is never any mud in it. When we remember the old-fashioned barn yard, with the cows wallowing knee deep in manure, we bless the day that set us to making a coal cinder yard.

THE PROFIT OF KINDLINESS.

Says a writer in the *Farm Journal*:

"My horse knows me as far as it can see me, and as I leave the wagon will look after me and watch for my re-appearance; then, if I wave my hand will come to me. Will yours do that?"

Right in that short paragraph lies a principle—the principle of kindness.

That principle is a harbor of safety for some men. Others avoid it and wreck their fortunes on the rocks of unkindness and spiteful usage. A boy once said to us:

"Father always speaks to the horses, the dog and me as if he couldn't bear to have us round."

Think how much that man missed in the kindly loyalty of boy, horses and dog.

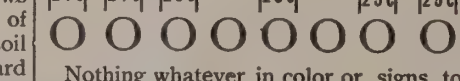
What is the matter with some men on the farm? They strike and scold cattle and horses and boys and everything else that dare not strike or talk back. And yet they are not unkind men at heart. Let a neighbor be in distress and they will do anything to relieve him.

They have got in the habit of loud speech and rough usage. It is costing them good money every day, but they don't see it.

Think how many weary steps that man whose words serve as our text, saved in catching his horse in pasture. Then, besides, does any one think the animal did any less work for loving his master as he did?

It is of especial importance that we deal kindly and gently with the cow if we expect the best possible profit from her service. The shrewd, far-seeing dairyman studies how to promote the comfort and contentment of his cows. "He knows where his bread is buttered." He keeps his mind alert to know what cow comfort is. For this reason he is gentle, quiet and patient, even with a fractious, ill-tempered cow. He banishes the cramped, confining stanchion; the deep and dangerous manure gutter; the crowding of cows uncomfortably and unhealthfully together in the stable. He has clear convictions as to what constitutes a well lighted, well ventilated, clean, healthful stable room.

Through all his management runs this principle of kindness, not only because it is the humane thing to do, but also because it *pays*.



In no other way can the boys, the hired men, the cows, the horses and all the animals or life of the farm be made to feel contented and happy on that farm. Every owner and manager of a farm should remember always, that he is the prime source from whence proceeds the spirit and atmosphere of that farm. He is to decide whether it shall be a genial, kindly farm life or not. And in no other way can it prove a truly successful, happy farm life for him and all concerned.

HOW THE OLEOMARGARINE LAW IS EVADED IN NEW ENGLAND.

The following extract from a private letter written by Mr. Geo. M. Whitaker former General Agent Dairy Bureau of Massachusetts, now connected with the U. S. Revenue Department, will serve to show the oleo snake still rears his counterfeit head in some of the principal butter markets of the east.

Mr. Whitaker says:

"I went into a New Haven (Conn) store a few days ago—a "butter" store. There were 12 opened tubs all in a row with placards announcing price something like this.

Nothing whatever in color or signs to show that all was not butter.

"Have you any renovated butter?" I asked.

"We have some *good* butter. I don't know whether it is renovated, I don't know much about that" was the reply.

A little was taken from one tub on the point of a knife. I recognized our old friend (?) and appeared satisfied.

"How much do you want?" was next asked me.

"I am more interested in looking at revenue stamps than purchasing" said I, walking behind the counter.

Nine of the 12 tubs were oleo, free from "artificial" coloration,—paying a quarter of a cent tax, and sold as butter.

Note the fact that these tubs were marked at a butter price, were declared by the clerk to be butter and as Mr. Whitaker says were "sold as butter."

He says they were free from "artifical" coloration but he does not say that they were not of a yellow color so as to all the more easily gull the consumer into supposing he was buying butter.

And yet amid all this fraud and evasion of law, with some of the oleo makers constantly before the courts for attempts to swindle the government out of the revenue tax, we have a lot of professional people and the National Cattlemen's Association declaring it to be a legitamate industry. If there ever was an unmitigated fraud and swindle, conceived in fraud and worked through fraud, it has been, and still is the oleomargarine industry.

WARM MILK FOR YOUNG CALVES.

The normal temperature of a healthy cow is 100° to 102° F. The temperature of the milk when first drawn from the udder is the same. Every experienced calf feeder will admit the superior quality and growth shown by calves which take their milk direct from the cow. There is much evidence in favor of the belief that a large share of this improvement in appearance and condition is due to the fact that the milk is at blood heat, and for that reason stimulates its own digestion.

Experiments have been carried on, both in Europe and America, on this point, all proving the great value of warm milk, whether whole or skimmed, over cold milk, as a food for young calves and pigs. When farmers separate their milk on the farm care should be taken to feed the skim milk at once, as soon as separated, to the calves especially. Many farmers wait for some time after separation before feeding the skim milk. Such practice shows that they are not good students of animal physiology. They have not studied the principles which govern the assimilation of food by young animals. Nature, when left to herself, generally does things pretty near right, and the animal mothers give their milk to their young in its best and most perfect state. But man steps in between nature and these farm babies and forgets to do all he can to help the young things to make up for the loss their unnatural condition imposes. This is another case where reading and study will help the farmer to better know his duty. If a man once knows his duty well and thoroughly he is much more apt to perform it than he is if he half knows it or admits it.

FACTS ABOUT ENSILAGE.

Some people assert that there are no well and thoroughly conducted experiments to prove that a field of corn put into the silo is worth any more in feeding power for milk, than the same field cut, put into the shock, the corn husked and ground and fed to the cows with the stalks.

In reply to this Mr. N. B. White in his book, "Thirty Years Among Cows," states his own experience to the contrary and cites the Vermont Experiment Station, which found that corn was worth more for milk in the form of ensilage than if handled in the usual way. Prof. Babcock of the Wisconsin Station found that the milk from ensilage feed exceeded the milk from dry feed in churnibility, 12 per cent. That is, the cream of ensilage milk gave up its butter fat in the churn 12 per cent better.

Some farmers seem to hesitate at the cost of ensilage machinery. We can see no reason for that, any more than that we should hesitate at the purchase of any farm machinery. The question applies there as it does everywhere else—Does it pay?

Farmers have some strange notions of economy. For instance: The present season has been a very difficult one to make good hay, particularly so with clover and alfalfa. We have harvested three crops of alfalfa hay from 32 acres. Some of it stood in the cock for twelve days, receiving three heavy rains. By reason of being covered with a 40-inch square hay cap, made of "A" sheeting, costing 12 cents each, all of this hay, or about 150 tons, has been secured in fairly good condition, and some of it very fine. Because some of the farmers of this county would not go to the expense of providing caps they have lost two-thirds of the feeding value of their alfalfa. We calculate that our 1,000 hay caps saved us at least $400 of feeding value in our alfalfa. Pretty good interest that on the original cost of $120. And so it is with the economy of the silo. All the necessary expense is a money-making investment.

BREEDING PRINCIPLES.

That there is such a thing as science in the breeding of our domestic animals is an assertion that needs no argument. Here and there in the world's history have been men who have demonstrated that they possessed a knowledge of that science. By the term "science" we mean just what is meant by the same term in chemistry—a knowledge of the underlying princples that govern the operations of nature.

Booth and Bates in Short-horns, Dauncey in Jerseys, and a host of studious, observing men who have done something to develop all classes of animals and fowls, all these men took hold on certain principles, worked out their problems, and developed their animals in given lines with more or less success, depending upon how well they saw and understood governing principles. In the September number of the *Century Magazine* is a very able article on "The Horse in America" written by John Gilmer Speed, a significant name by the way. It will well pay every farmer who is interested in the idea of breeding farm animals, (and all farmers should be so interested) to read this article. We have not space to speak of it farther than to quote one very significant sentence, with a few comments.

In speaking of the Henry Clay family of horses who were of a distinct and prepotent type, the writer says:

"This type fortunately has not entirely perished, but so little of the blood has been preserved that the type is all but gone. Here was another victim of the Hambletonian craze and of the mistaken idea that 'like begets like,' *without regard to the important blood influences which are all-controlling*. Would a forester plant an acorn in a grove of maples and expect to get a combination of oak and maple because the ground had nurtured maples before and was peculiarly adapted to that kind of tree?

We have italicized the words in the above pithy statement to which we wish to call the attention of those farmers who want good milking cattle, who subject themselves to the expense of keeping cows for their milk, and who are seeking good profit, but who in our opinion, act just as unwisely in handling breeding machinery, as would the man who would plant an acorn in a maple grove and expect to get a combination of oak and maple.

To that class belong the men who breed to the Holstein sire for quantity, and the next generation they breed to a Jersey or Guernsey for more butter fat, and finally breed the result of these two opposing traits to a Short-horn for meat and size.

As Mr. Speed says, they are governed with the idea that "like begets like" without regard to the great ruling fact that "blood influences control." If we undertake to unite opposing traits and tendencies, we play one against the other and end in neutralizing both.

Out of just this unscientific notion of "succotash breeding" has come the folly of dual-purpose breeding. Away go thousands of farmers on this idea, thinking that all they have to do is to put their hand into this dual-purpose rag-bag and take out an all-sorts combination that will bring them the best profit. Nature establishes no certain and steadfast prepotencies in that way. It is no sign that because we want a thing we can have it.

Such men forget or ignore the great ruling principles that govern the development of animals in any given direction. They forget the history of animal breeding, and ignore the great basic fact that the men who have developed the qualities of cattle for beef, or for a large flow of milk, or for richness of butter fat, have been obliged to follow the law of "specific purpose."

In this way and only in this way, were the Short-horns, the Herefords, the Polled

Angus, the Galloways, the Red Polls, the Devons and all breeds of beef cattle established so that they will reproduce the same qualities with profitable certainty.

In this way and only in this way, have the milk, and butter qualities of the dairy breeds been established.

The men who bred for beef *or* milk, understood the governing principles that Nature works with. They saw that she works always in straight lines; that she first establishes a type by long-time breeding in one direction, just as the mustang horses, or Texan cattle, were established. They saw clearly that the moment a departure is made from specific type, that moment are we setting up warring, and not agreeing, tendencies. We have introduced confusion and reversion, and destroyed prepotency and certainty of result.

Therefore those dairy farmers, (and by dairy farmers we mean those men who seek their largest profit at the pail) who are filled with the idea of breeding in what they call "dual-purpose" or "general-purpose" lines, should consider whether Nature and her established principles in reproduction endorse such ideas or not.

It will take but a moment to see that the hodge-podge, unsatisfactory character of our cattle in general, has been brought about by this same general-purpose idea, breeding for everything in general and nothing in particular.

It will take but a moment to see that such breeding usually results in deterioration and not in improvement. The logical outcome of such ideas is the scrub, whom an Irishman once wittily described as "a nine-spot, neither high nor low, nor worth a dang for game."

THE BROADMOORE DAIRY.

The Broadmoore Dairy of Colorado Springs, Col., is under the management of Mr. H. R. Blair.

The annual report from May 1st, 1902, to April 1st, 1903, shows as follows:

Average number of cows for the year, 139.

	Lbs.	Cost.
Alfalfa hay fed	712,237	$3,561.11
Alfalfa soiled	855,061	1,068.82
Bran fed	278,962	2,510.66
Corn-chop fed	29,893	269.04
Silage	445,136	445.31
Milk produced	1,005,149.5	$7,854.76
Average lactation period, mos.		9.3
Average herd test, butter fat, per cent		4.1
Feed cost per pound milk		$0.007
Average milk per cow, lbs		7,211.23
Average butter-fat per cow, lbs.		295.66
Butter per cow, 1-6 overrun, lbs		344.93

The above is a very large average per cow considering the number of cows in the herd.

Some Pertinent Problems.

Should Ventilation Be From Floor or Ceiling?—Which Way Should Cattle Face in Stable?—Which is the Healthier, Holstein or Jersey Milk?—Milk From Pregnant Cows.—Results of Spaying Cows.

ED. HOARD'S DAIRYMAN:—I notice when writing in regard to ventilation of cow stables you say that the ventilating shaft should start near the floor and go out at the roof,

At the Wisconsin Agricultural College last winter Prof. Whitson said that the air in a stable was always in motion and that the shaft should start from the ceiling, though I notice in Physics of Agriculture that the shaft is begun near the floor. Which is best?

Why do you plan to face the cattle towards the wall? It seems to me that a cow must enjoy looking across at her neighbors rather than to look at a wall, and that the sunshine might better come towards her from the rear than to shine in her eyes, and that she could be more conveniently fed, especially when using soiling crops, by the cows facing together, and that the manure could be just as easily removed by carrier either way. The idea that the cows breathe toward one another amounts to little, because they do that to their neighbors on each side of them.

Which is the healthier milk for children, milk like the Holstein, rather low in per cent of fat, or milk like the Jersey's?

Is milk more nourishing from a fresh cow, or one not in calf?

Do you know of any experiments made in spraying cows? If so, what were the results and conclusions? MAX.

Suffolk Co., N. Y.

While it is doubtless true that "the air in a stable is always in motion" and that in consequence the various gasses are so much distributed that, with a continual inflow of pure air, ventilation from the ceiling would carry off a large proportion of the vitiated air, it still remains that there is so little of this "motion" that the temperature at the floor may be several degrees lower than at the ceiling. In ventilating a stable or a house it is expedient in winter to draw off this colder stratum of air and thus induce the warmer air at the ceiling to descend. On the contrary, during the heat of summer, openings at the ceiling, to allow the escape of the hot air, are very desirable. Therefore we advise building ventilating flues from the floor, and also providing openings into same at the ceiling, to be closed or opened as circumstances may dictate.

The question of facing double rows of cows one way or the other in a stable is not a very vital one, and the pros and cons are perhaps about equally balanced. If it is a trifle more convenient to distribute feeds of all kinds—not soiling crops alone—from a central feeding alley, is it not equally true that it is somewhat more convenient to remove the manure from a central driveway, than from passage ways at opposite sides? Just how much more enjoyment a cow may obtain from looking other cows in the face than from looking at the blank wall, with sidelong glances at her neighbors on either side, or whether light and sunshine coming from the rear would be more agreeable than coming from the front, are questions that we do not feel competent to discuss, much less decide. We do know, however, that current theories point to the conclusion that danger of infection is increased by compelling cows to breathe the air expelled from other cow's lungs and that the less exposure of his kind the better.

However, the determining factors with us are that it appears to be more convenient to have both rows of cows enter and leave by a common doorway; to have the cows in both rows accessible for milking or other purposes from a common passage; to arrange stable so that cows may be changed from one row to the other without having to take them out of doors or up or down to find a cross-passage way.

The average percentage composition of human milk is said to be 87.41 parts water; 3.78 parts fat; 2.29 parts casein and albumen; 6.21 parts milk sugar and 0.31 parts ash. The nearer cows' milk approaches this composition, the more fit would it be, one would think, for feeding infants. All cows' milk contains too much casein and too little sugar. Hence there is a growing demand, especially in cities, for what is known as modified milk, that is, for milk to which cream and water and milk sugar may have been added, so as to reduce the proportion of casein and increase that of the sugar. Whether Holstein milk is better for this purpose than Jersey milk, we are unable to say. For children past the age of infancy, Holstein milk may be the better for such as are inclined to be over fat, and Jersey milk more suitable for such as are of too spare a habit.

The next inquiry has never been scientifically investigated, so far as our reading has extended, but there is a fairly well founded opinion that the milk of cows advanced in gestation is not as satisfactory for any purpose as that from fresh or farrow cows.

There are all sorts of reports about the results obtained from spaying cows, some very favorable and others just as decidedly unfavorable. There has not been enough experience in this line to justify any generalizing. Perhaps the temperament of the animal operated upon, whether it inclines to beef or milk, may account for much of the discrepancy in the testimony.

An Exceptionally Bad Creamery.

ED. HOARD'S DAIRYMAN:—There are many successfully managed farmers' creameries in our state, but I occasionally learn of an instance where the attempts to save pennies is the means of losing dollars, and one of these has just come to my notice. After hearing the story and investigating the circumstances I was reminded of what a successful creamery owner in this state once told me. He said that the only kind of creameries he cared to buy now days were those which the farmers had tried to manage and made a failure of. He could generally get these factories at a very low price, and by his methods of spending some money and fitting up the factory with modern machines and appliances and giving the butter maker a fair chance to do good work, he could soon transform the place into a creamery that the patrons respected and that made some money for him and for the farmers.

The particular instance that I have in mind is a good illustration of a lack of ability to comprehend the necessity of spending some money to help make some more money and to prevent the loss of what has been earned.

A co-operative creamery in the north central part of the state had managed to worry along for 3 years with a fair building and some second hand machinery which had been bought because it was cheap. Here is where the management made its first mistake. The old style and out-of-date machines were fit only for the junk pile, but they could be bought cheap and had been used in a creamery before, so that it was assumed that they could be used again.

The factory received but very little milk for the first few years and managed to worry along and accumulate a considerable number of evidences of neglect without spending anything for repairs or losing much on the butter. This condition of affairs might have continued until the place finally decayed sufficiently to be plowed under the sod and leave no reminders that there ever had been a creamery here, except for the rank weeds that grew on the filth fertilized soil. The unusual rains of the past season, however, kept up the pastures so much better than formerly that the milk and cream supply this year reached a point that had never been heard of before.

Now was the time for the management to take advantage of the opportunity to make some money by spending some money in getting an adequate equipment for the factory, with machines capable of handling the increase in milk. Did they do it? No! They wrote to the Dairy School for a buttermaker and got a first-class man who had made butter successfully for three years before taking hold of this factory.

His experience and training, however, led him to ask that the rotten walls of the refrigerator be repaired so as to help prevent the loss they were having from mold, as reported by the commission man who bought the butter. He also asked for a new, modern churn, as the one in the factory was probably the only one of the kind ever made, and an experiment of some manufacturer who never made another one like it. This was the second-hand churn bought cheap when the factory started.

The separator in the creamery was also out of date, and the new buttermaker reported to the president of the company that the skim milk tested one-half of one per cent fat. This is a loss of twelve per cent of the fat in the milk, provided the milk tested 4.0% fat.

The creamery was receiving, at this time, 15,000 lbs. of milk per day, and a loss of 0.5% fat in the skim milk would amount to 75 lbs. of fat which, at 20 cents per lb., means $15.00 per day being lost by using the cheap second-hand separator. In 70 days this loss would pay for two modern, up-to-date machines that would save many dollars to the farmers in a year.

Probably the greatest piece of folly about the factory, was the determination of the management to continue their old practice of holding the buttermilk in one side of the twin cream ripening vat. The new butter maker asked to have some sort of a clean tank provided for this buttermilk, so that he could use both sides of the cream vat for his constantly increasing cream supply. This, the management refused to furnish, because the patrons took their buttermilk home to drink, and they had always done this way in the past and ought to continue to do so in the future.

The butter maker tried to skim a richer cream so as to be able to get it all into the one side of the ripening vat, and leave the other side for buttermilk. In fact this buttermaker labored very patiently with the men and the machines he had to deal with, but he has concluded that he cannot hope to stay in such a place because he is afraid, his reputation might suffer from the failure to make any headway against such odds as he has encountered up to the present time.

Such instances as this are rare, as we have many first-class creameries in the state that are managed by broad-minded farmers, but the occasional factory of this sort, shows the great need there is in Wisconsin of creamery inspectors. We ought to have ten of them constantly at work. E. H. FARRINGTON.

Wisconsin, Dairy School.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Feeding Heifers.

Have 12 yearling heifers not yet bred, which I wish to raise for milch cows. Will feed timothy hay and would like to know what grains would be the cheapest and best at the following prices; also how much grain to feed per day to make them grow right along this winter. Chop feed $22 per ton; oil meal, $23; bran, $17; flour middlings, $22; oats 35 cents per bushel; corn 50 cents per bushel. Also what difference in grain if I feed half timothy and one-half clover hay? M. C.

Manchester, Ia.

Heifers intended for the dairy should be fed for growth and development along dairy lines and not along beef lines. Early development is not particularly desirable and excessive laying on of flesh and rounding out with fat are to be carefully avoided. To this end, the digestive organs should be called upon for a goodly amount of daily exercise. "Use breeds strength" as well in the muscular and secretory functions of the stomach as in the muscles of the limbs of man or beast. Therefore, we advise feeding these heifers all the mixed clover and timothy hay they will eat without waste, with a moderate daily allowance of salt to aid digestion and assimilation. The probabilities are they will not need any grain, but an occasional mess of silage or roots, or better, a small daily allowance would be beneficial. We specify the mixed hay in preference to clear timothy, because it contains more muscle building nutriment and more mineral matter for building up and strengthening the bones. If on hay alone and the daily allowance of salt, the droppings become too dry and hard a little oil meal will be indicated. Circumstances must determine the amount. If the heifers thrive and appear active and hearty, do not be concerned if they fail to increase in weight as one should expect of steers. But if for any reason they do not appear to be thrifty, or do not make satisfactory growth, feed a mixture of bran and ground corn, equal parts by weight, in such amounts as conditions may require.

Amount of Butter from Four Per Cent Milk.

Farrington and Woll's table says that 85 lbs. of milk testing 4 per cent, will yield 3.7 lbs. of butter. The *N. Y. Farmer* says 85 lbs. of milk at 4 per cent will yield 4 lbs. of butter. Which is right? F. B.

Mongaup Valley, N. Y.

However paradoxical it may appear, the truth is that both statements are correct. Farrington and Woll's table gives the very smallest yield that can be accepted without challenging instant attention and suspicion that there is something wrong. When the overrun falls below 11 per cent, it is conclusive that there are needless losses. Both creameries and dairies should do somewhat better than this, but such an overrun is quite as much as many of them have shown.

In like manner it must be conceded that with everything in best condition, with the highest degree of care and skill on the part of the operator, with separators not overcrowded, or run too long without cleaning, it is quite possible to make 4 lbs. of butter from 85 lbs. of 4 per cent milk. This is simply adding one-sixth, and is the rule followed in estimating the yield of a cow. But such an overrun cannot be expected in regular creamery work.

Fir Saw Dust for Bedding.

My dairy farm is so situated that it is difficult for me to arrange satisfactorily the matter of bedding for the cattle. We have no straw on the place and cannot get any at a reasonable expense. I can get fir sawdust without difficulty. There is a popular impression here that the use of fir sawdust is objectionable because injurious to the land upon which the manure is spread. Two reasons are given: One being that the turpentine, pitch or other ingredients of the sawdust are injurious to plant production: and the other, that the sawdust tends to make the soil dryer. L. T. T.
Seattle, Wash.

We should not hesitate to use the fir saw dust for bedding in a cow stable. Similar objections have been made in Wisconsin to the use of pine saw dust and shavings, but actual use of pine shavings on our own farms and gardens and by some of our neighbors has not proven objectionable in any degree. On the contrary, we have fancied the texture of the soil has been improved. Possibly, excessive amount of this saw dust in particular spots might temporarily be injurious, but the amount that would ordinarily be employed cannot, in our opinion, have any injurious effect.

Duration of Red Clover Seeding—An Alfalfa Inquiry.

Will enough red clover come on the third season to make a profitable hay crop? I am aware that botanists say the clover plants live but two years. My neighbor (an old country German) says: "Leave it another year."

How would it do to sow clover sod to alfalfa? The latter does well here, two cuttings from four acres, made fourteen big loads, and the land is far from rich. C. A. D.
Milton Junction, Wis.

Common red clover is strictly a biennial plant. Seeded in the spring it does not come to maturity and bear seed the same season, but does seed the second year, and each plant thus maturing ordinarily terminates its life. Under extra favorable conditions some roots will live over after producing seed, and there will also be some plants that do not bear seed that will grow the third year. Usually there are not enough of these to make a profitable crop the third year. One can probably ascertain in the spring whether there are enough plants alive to make it expedient to reserve the field for a hay crop.

We should not expect very much success in attempting to secure a good stand of alfalfa by seeding on a clover sod, except by plowing down all the live clover. On the spots where there was any considerable clover, the young alfalfa plants would probably be smothered.

Does Sorghum Seed Diminish Milk Flow?

Our herd of cows has been doing reasonably on native pasture consisting of prairie grass, Japan clover and other wild grasses which grow upon our prairie lands when pastured awhile. Recently a short drouth came upon us and to keep cows from shrinking in flow of milk we began to feed sorghum, the seed of which was about half ripe. In spite of the fact we fed sorghum freely, our cows have dropped off nearly one-half in milk flow. Some of our farmers affirm that sorghum seed will dry up a cow. Have you any information that will verify this claim? We fed sorghum silage successfully last year. B. D. M.
Carlisle, Ark.

There is perhaps no conclusive testimony upon this point either way. In a single experiment at the New Jersey Experiment Station several years ago, the substitution of sorghum seed meal for corn meal reduced the average yield of the three cows from 28.1 lbs. to 24.6 lbs. and when put back upon corn meal the yield increased to 27 lbs. On the other hand, chemical analysis fails to show any principle in sorghum seed—at least when ripe—that should cause shrinkage. There is, however, a more or less wide spread belief that sorghum seed does tend to decrease the flow of milk, and possibly the unripe seed may be more objectionable than that which has matured.

Cow Stable Queries.

Would you please publish in your next paper a good plan for my barn, which is 24x44. The cows now face towards the wall and are tied with chains. Am intending to put a feeding alley in the middle and have the cows face each other and also put in stanchions. Will six inches of fine crushed stone mixed with cement, tamped solid, make a good floor for cows to stand on? Would also like to know which are the best stanchions.
Haven, Wis. G. F. G.

A stable only 24 feet wide does not afford promise of a very satisfactory arrangement. It requires not less than 6 feet to supply standing and feeding room for even a small cow, and 7 feet is none too much for larger cows. At the very least then 12 feet in width must be exclusively devoted to the cows. Deducting also for the frame and siding of the barn, there will remain 11 feet for gutters and passage ways. If the cows face inwards, there should be at least 4 feet between mangers for a feeding alley (and more would be better,) and this will leave 3½ feet on either side for a gutter and walk for cows to pass.

If the cows are faced to the wall and there be allowed the same space for getting the feed to the cows, namely, 2 feet on each side, and give each rowof cows the same space, there will remain a central alley 7 feet wide, or 5 feet between gutters, for cows to come in and go out, and for milkers to go back and forth. This, in our judgment, will be the more convenient arrangement.

We do not approve the concrete platform for cows to stand on and much less for cows to lie on. Unless heavily bedded they are cold, and a prolific source of rheumatism and garget.

The swing stanchions are such a decided improvement over the rigid stanchion, that the latter should be banished from every cow stable.

Farm and City Life.

ED. HOARD'S DAIRYMAN:—I believe I am qualified to comment on the charge of H. C. R. as published on page 717, that people are leaving the farm because they do not like to work and imagine that there is a living in town without work. I do not accept that statement. I saw little but farm life before I was 22 and I have seen a good deal of it since that time. We have always had a farm in the family, and a good one, though I do not manage it.

No, there is nothing gained by misstating the case. It is overwork that is mainly to blame for the lack of farm workers. My wife refuses to return to the farm on any terms because she broke down there, not being made of cast iron as her parents were. Why is it in the city that a girl will work in the shop and fairly starve when she could always be laying up money at domestic service? Nothing in the world but the fact that in one case her work is done sometime and in the other it never is.

It is just so between farm work and shop work for men. The farmer has an idea that he must rise at 4 a. m. and work till 8. p. m. or he is not doing his duty, and there is Sunday work always besides. Who would be willing to work in this way except for himself if he could get a job of eight or nine hours that would support him? The lack of farm help is the answer to the question. Now what are we going to do? Shall we cut our farms down till we can work them ourselves or shall we try to stand the present awful system till the gas engine is ready to help us out, as it will before long, I verily believe?

I say neither. I have lived on farm and in town and observed both side by side long enough to be prepared to assert that the thing that is killing farming is waste. There is waste enough on most of the farms I visit to pay abundantly for help needed and at reasonable hours and leave a good margin after that. I will say nothing of antiquated methods that contribute to the same end, but will try to point out what I believe would be a remedy in whole, or in great part.

In the first place, the work on a farm should be arranged so that the farmer could say to his hired help: "I want you to work for me an entire year and if we can agree I want you another year. I do not believe in the policy of working my help to death in the warm part of the year and turning it off to do nothing for at least four months of the year."

I am convinced that there is work enough that can be left over till winter to keep men earning something then. Let the barns and stables be made light and warm, let the dairy be reasonably large, let the grain be left over to be thrashed by a small machine in winter, let the coarse feed all be cut up before feeding, let ration be the rule of feeding instead of feeding by guess, as we were all taught to do, let the manure be drawn out as it is made, let the making of all farm appliances, such as gates, bushel crates and a thousand other things that are mostly labor, let all repair work that a handy farmer can do, be put into the winter schedule, let winter hours be only from daylight to dark and there would be winter work, and the summer rush would not need to be what it is.

The farmer who has much more work to be done than he can do, should not labor with his hands nearly so much as he should study. He should watch every inch of his farm every day, or something will get the start of him. One of the great sources of worry and loss, is from excessive dry or wet weather. Sometimes the weather changes its entire tac-

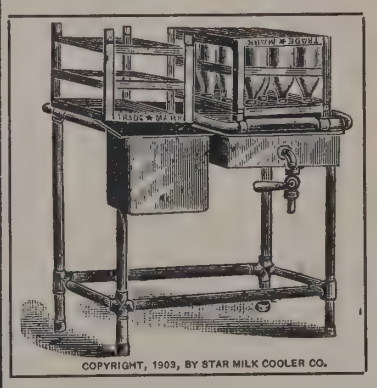
THE U. S. WINS
IN MINNESOTA

The butter in the Dairy Class that received the **Highest Score at the 1903 State Fair** was made from the U. S. Separator Cream, as testified to by the recipient:

OWATONNA, MINN., September 8, 1903.
This is to certify that the first prize dairy butter at Minnesota State Fair was made from cream separated by the U. S. Separator.
MRS. J. H MCROSTIE.

Ju t notice the following letter also:

ROCHESTER, MINN., September 2, 1903.
Have handled the U. S. Separator for the past five years. The first year I sold about 46 machines. Looking over my books this spring, I find there are 30 out of the 46 sold the first year that have cost their owners NOT ONE CENT for repairs during the five years they have run them. P. D. ANDERSON KEEL.



The above letters tell very emphatically the worth and popularity of the **Separator That Stands Without a Peer, the Improved U. S.** For further particulars, write for catalogues.

We transfer our separators from Chicago, Minneapolis, La Crosse, Sioux City, and Omaha. Address all letters to Bellows Falls, Vermont.

tics, as it did here, from no rain to all rain, this year about the first of June. It is hard to square a farm to such a radical change, but some of our farmers did it. They caught the few dry weeks and cultivated their hoed crops until they have corn now, while their neighbors have none. They watched their potatoes and headed off the blight, so that the crop grew, while that of their neighbors died before the potato was full grown. They watched the weather and got hay and grain in without rain on them. It is not the hard work alone that counts. It is the right sort of watchfulness.

Two fields of our farm were rented this season. The tenants were neighbors. One tilled his field well and when crop was ripe, he gathered it. He got out of it a big yield and he got all that grew. Both sowed oats. The other was late in putting his crop in. He hurried the fitting of the soil and the crop was much lighter than the other, though the land was quite as good. Then he harvested the crop and let it stand and get very much colored by rain, though the other offered to help him draw it in. I believe one of these fields netted $10 an acre more than the other did, and all on account of better farming. One of these men can pay for hired help, the other cannot. JOHN CHAMBERLIN.

Erie Co., N. Y.

A Warning to Patrons of Local Creameries.

ED. HOARD'S DAIRYMAN:—I am informed by an article in one of the daily papers that the Milwaukee railroad is making an effort to consolidate the creameries along its line. The plan, it is claimed, is to interest dairymen in the butter manufacturing plants located in the large cities and towns, by offering better prices for their product. This means that the railroad mentioned is, by granting special low rates to central churning plants, doing that which will have a tendency to destroy the local creameries which it has for the past decade assisted in promoting and fostering. The railroad's reward, says the report, will be the tariff derived from the shipment of the cream to the central churning plants, overlooking the fact that in closing the local creamery the railroad loses the freight it paid for coal, tubs and other supplies.

It seems almost incredible that a railway company should encourage any movement which is calculated to break down the local creameries which have accomplished so much in bringing prosperity and wealth to its constituents who, before the advent of the creamery, were in financial distress and many in actual poverty. It is impossible for the railway to get any benefit from such a change except the extra business that would come to it in taking the cream from the local station to the central plant.

The fact that the expense to get the cream to the central churning plant and the cost of manufacture there is greater than the cost of manufacture in our well regulated co-operative creameries, and the additional fact that butter made in these central plants from cream delivered only two or three times a week, will have to be sold at a cent or so less per pound than it would be sold for if made in the local separator creamery, makes it evident that the freight charges for the cream, and the profit taken by the central plant, have to be paid by the milk producer. Even if, for the time being, the rates for transporting the cream to the central plant and the butter to market, are made so low that as much is realized by the milk producers as they do by manufacturing the butter in their home creamery, what assurance is there that the low rates will be continued after the home creamery has been closed and the local co-operative creamery association dissolved?

It is only a few years ago that a railroad made similar special low rates on cream to a central churning plant at Topeka, by which that plant was enabled to get control of nearly all the creameries in Kansas. After the local creameries were closed, the local creamery organizations abandoned and each farmer was dealing independently with the central churning plant, the special low rates were discontinued and the profits in dairying were reduced.

In this matter we are not disposed to quarrel with the railway companies, it is their business to get freight; nor with the central churning plants for soliciting cream; but when the farmers' co-operative creamery is likened unto the farmer's plowing with a stick, harvesting with a sickle and threshing with a flail, and the central churning plant placed on a level with the modern gang plow, the self-binding harvester and the steam thresher, I feel called upon to nudge the patron of the co-operative creamery and shake my head.

The claim is made that "the plan is in accord with the present age of consolidation and centralization." We question the wisdom of the railroads in promoting this movement, for there is no one thing that so tends to stiffen prices of railway stocks and bonds, and increase freight and passenger receipts as a prosperous contitutency.

The farmers' co-operative creamery is the best institution that ever came to the dairymen of the northwest; it has done more for them than any other organization, because it brings the profits to the producer—where they belong; it has done more for the material interests of the farmer than any other institution in the state, and if the farmers know what is to their interest they will let well enough alone, stand by their home creameries and let the central churning plants look for patronage to those who have not learned by experience, the great benefits (pecuniary and social) that come to every community that gives strong support to a co-operative creamery.

T. L. HAECKER.

IS YOUR STOMACH ON A STRIKE?

There is Nothing to Prevent You Employing a Substitute to Do its Work.

There is such a thing as forbearance ceasing to be a virtue even in the case of one's stomach. There is no question but that some stomachs will stand a great deal more wear and tear and abuse than others, but they all have their limit and when that limit is reached, the stomach must be reckoned with as sure as fate. The best way and really the only effective way to treat your stomach when it rebels is to employ a substitute to do its work. This will give the weakened and worn-out organ an opportunity to rest and regain its strength and health.

Stuart's Dyspepsia Tablets relieve the stomach of its work by taking up the work and doing it just as one set or shift of workmen relieves another. They actually digest the food in just the same manner and just the same time as the digestive fluids of a sound stomach do. In fact, when dissolved in the stomach, they are digestive fluids for they contain exactly the same constituents and elements as the gastric juice and other digestive fluids of the stomach. No matter what the condition of the stomach is, their work is just the same. They work in their own natural way without regard to surrounding conditions.

The stomach being thus relieved by Stuart's Dyspepsia Tablets, is restored and renewed by Nature and the rest of the human body does not suffer in the least by reason of its failure to perform its work.

A Wisconsin man says: "I suffered the pangs of dyspepsia for 10 years. I tried every known remedy with indifferent results until I was told of the remarkable cures of Stuart's Dyspepsia Tablets I bought a box, began taking them and forgot I had a stomach. Three boxes cured me completely. I have had no trouble whatever for a year and have an appetite like a harvest hand and can eat anything that is set before me without fear of bad results."

Stuart's Dyspepsia Tablets are for sale by all druggists at 50c a box. The druggist never fails to have them in stock because the demand for them is so great and so pronounced that he cannot afford to be without them. People who could not get them from one druggist would go to another and would get in the habit of buying their other drugs there as well as their Stuart's Dyspepsia Tablets.

How a City Milk Inspector Tested Milk.

A good commentary on the knowledge of dairy methods is found in the way a Chicago milk inspector, who went out to DeKalb, Ill., to test some cows and thereby trace to its fountain head the source of Chicago's poor milk. He took with him some young doctors who were equally wise in milk production. They came, milked and tested and the following letter shows the extent of their wisdom:

EDITOR RECORD HERALD:—I notice in one of your contemporaries today that by the tests taken by Mr. Patterson of the pure food commission and Mr. Grady of the city milk inspection bureau the Holstein cow is condemned on the sample of milk taken from the cow that Mr. Patterson milked.

Now, as I was there on the invitation from Mr. Gurler, I happen to know something about the whole proceedings and especially in regard to the milking of the Holstein cow in question. I naturally supposed all the facts would be given for publication, but for some reason they do not appear in either of the reports; hence, in justice to the dairymen in whose interests it is my duty to speak, and to do justice to that noble breed of dairy cattle that are being so much maligned by the city inspectors, I state the facts from a dairyman's standpoint.

Mr. Patterson did not milk the cow; he only partially milked her. He milked from the cow eleven pounds of milk, which, according to the published reports tested only 2.8% butter fat. But what followed? I had one of Mr. Gurler's regular milkers take the cow immediately after Mr. Patterson was through and he got three pounds more milk from her.

This can be verified by Mr. Lundberg, of DeKalb, Alderman Fowler, of Chicago, and A. J. Glover and myself. Four tests were made of this 3 pounds of milk and it tested 6%, which does not surprise anyone conversant with the quality of the last milk drawn from a cow, compared with the first drawn. Thus we have the following to submit as the test of the Holstein cow's milk that Mr. Patterson was supposed to have milked:

	Test.	
Eleven pounds milked by Mr. Patterson	2.8	.308
Three pounds milked by Mr. Gurler's milker	6.0	.180
		.488
Fourteen pounds of milk, average	3.485	.488

As the state test is 3%, this Holstein cow is still nearly 0.5 above. Why this was given to the public at 2.8 I fail to understand, as I informed Mr. Patterson what we had done before leaving the barn, wishing to be honest with him in the matter.

I am not personally interested in any Holstein cows, but I want to see fair play for all dairy breeds. I love the Jerseys and Guernseys, consider the Ayrshires splendid milkers, learning more every year in regard to the Brown Swiss, and for an all round animal; believe the Durhams cannot be beaten. Yours for simple justice to the Holstein.

JOSEPH NEWMAN.

President Illinois Dairymen's Association.

Advantages and Disadvantages of Pasteurizing.

[From Prof. Dean's Book, "Canadian Dairying."]

"The chief advantages of pasteurization for butter making are:

1. It destroys the germ life of milk or cream to a large extent, especially when heated to 185 degrees, which is the temperature to be recommended. A clean seed-bed is thus prepared for the proper germs to give fine flavor to the butter.

2. It tends to eliminate stable and feed flavors from milk and cream, especially with milk in winter.

3. The ripening of the cream may be controlled by the butter maker, which is the important point in making good butter.

4. In case of bad-flavored milk, it enables the butter maker to improve very much the quality of his goods.

5. By the use of pure cultures (commonly called "starters") a more uniform quality is produced from day to day throughout the year.

6. The butter possesses an improved keeping quality, hence is better suited for the export trade, as our butter does not reach the consumer for two to four weeks after being made.

7. An improved quality of butter may be produced at cream-gathering creameries by pasteurization of the cream when sweet. The pasteurization of sour cream is attended with more labor and more difficulties, and the results are not so good. It is difficult to pasteurize milk or cream which contains more than 0.1 per cent of acid. However, after natural coagulation takes place in the cream, which will be when it contains 0.4 to 0.5 per cent of acid, the work may be done fairly well but is usually attended with considerable loss.

8. There is less loss in the skim milk when the whole milk is pasteurized before separating, especially in winter. We have used nearly all the leading makes of separators for creaming hot milk. The upper bearing of the machine needs to be somewhat more loose than when running through milk at a temperature of 100 degrees, and plenty of good oil is required to lubricate the bearing when separating pasteurized milk.

9. A better quality of skim milk may

Our New Catalogue is Now Ready

Catalogue No. 72, fresh from the printing presses and containing more goods that are really up-to-date and of the very latest style and design than any other six catalogues published, is now ready for distribution.

It will save you money on everything you buy and enables you to make your selections as readily and satisfactorily as if you could come to Chicago every day. It puts you in direct touch with the great markets of the world and places before you a stock of first-class goods more complete in every detail than has ever before been offered by any firm and at prices that are positively the lowest, when the reliable quality of the merchandise is taken into consideration. This catalogue contains over 1,100 pages of quotations on reliable merchandise of every description. No matter what you may need, you will find the article fully described and illustrated in our great book at a price that no shrewd buyer should overlook.

More than 2,000,000 people sent us orders last year—many of them were your neighbors. They gave us their business simply because we sold them reliable goods for less money than they could buy the same goods for elsewhere and at the end of the year found that they had made an average saving of 25 per cent on their purchases. If your neighbors find it to their advantage to trade with us, why can't you? If you have never traded with us, now is the time to begin. Ordering from a great catalogue is convenient and satisfactory; in the leisure of your own home you can make selection from a mammoth stock of thoroughly reliable merchandise, all quoted at the lowest possible prices.

You can, if you desire, compare prices with those you have been accustomed to pay and you can thus get better results than by making a hasty examination at a local store. You not only have the advantage of your own deliberate judgment but you are protected by the strongest guarantee ever made by any mercantile house, for we extend to all purchasers the privilege of returning goods at our expense if they are not satisfied with their purchases; and, even more, we agree to replace any shipment damaged or lost in transit; in other words, we assume all the responsibility.

In 1872 we originated the catalogue plan of buying and during the thirty-two years of our life have grown steadily each year until our business is now one of the largest in the world. We reached this position by treating people fairly, giving honest value and avoiding all forms of trickery, exaggeration, or misrepresentation. With Catalogue No. 72 in your possession you can buy from us almost as easily as if you visited our store in person, and we cordially invite every person desiring reliable goods at wholesale prices to fill out coupon at the right and send for a copy. The book is new from cover to cover; contains all the new goods of the season; is complete in every department; so there is no better time than the present to send for a copy and begin trading with us if you are satisfied with our prices and goods. The experiment will cost you only 15 cents. It may result in a saving of hundreds of dollars the first year.

Catalogue No. 72 Contains

17,000 pictures of the things that we describe. 70,000 prices on them. The prices are the lowest wholesale prices on the market.

We Bring Buyer and Seller Together

Do you wish to sell or exchange your farm, creamery or cheese factory? No matter where located—east, west, north, or south. Write for our new plan. We put you in direct communication with buyer. Save the big commission which agents would charge.

HILES & MYERS, C-100 MATTHEWS BLDG., MILWAUKEE, WIS

be returned to the farmers by sending it home hot. There is also less danger of spreading disease. In Denmark all skimmilk and buttermilk must be heated to 180 degrees before it is returned to the farmer. This plan has materially lessened the spread of tuberculosis in that country. Hydrogen peroxide is used to test whether the dairy products have been pasteurized, and the law is rigidly enforced.

The disadvantages of pasteurization are:

1. The extra cost for labor and machinery to heat and afterward cool the milk or cream. A milk pasturizer that will heat milk for two power separators will cost $150 to $200.

2. There is difficulty in pasteurizing milk or cream which is "over-ripe," and this may cause trouble in hot weather, when milk or cream is not properly cared for and cooled at the farm and is delivered in poor condition.

3. Some trouble is experienced from the froth which rises on the milk as a result of heating. No practicable remedy for this has yet been discovered.

4. There is a tendency to lack of flavor, and sometimes there is a slightly "cooked" flavor as a result of pasteurization. The cooked flavor usually disappears in less than two weeks. Lack of flavor is objectionable in local markets.

Two points are essential if pasteurization is practized:—proper means of heating and cooling the cream and the use of a proper culture to give the desired flavor to the cream and butter. Commercial cultures should be propagated three or four times in pasteurized skimmilk before they are used in cream for ripening in order to get the best results.

FOND DU LAC, Wis., Sept. 28—Cheese—Sales at Dairy Board today were 308 Twins at 11⅜c; 318 Daisies, at 11¾c; 100 at 11⅞c. Market active.

ST. LOUIS, Sept. 21—Butter—Steady; creamery, 22@22½c; dairy, 14@17c.

Eggs—19c, loss off.

KANSAS CITY, Sept. 28— Butter — Creamery, 18½@19½c; dairy, fancy, 17c.

Eggs—Weak; Missouri and Kansas, cases returned, 17½c; new No. 2, white wood cases included, 18c.

BOSTON, Mass. Sept. 28 —Butter—Creamery, western extra, 22@22½c; western firsts, 19½@20½c; dairy, 15½@21½c; imitation creamery, 16c; ladle, 14@15½c; box and print, 16@23c.

Cheese—Choice, 11¾@12c; Wisconsin, Twins, 11@12c; Ohio, flat, 10½@11c.

Eggs—Nearby, 32c; western selected, 23@24c; poor to fair, 17@18c; Illinois, 20@21c.

NEW YORK, N. Y., Sept. 28—Butter—Receipts, 9,439 pkgs.; market steady; state dairy, 15@20c; extra creamery, 21½c; common to choice, 16@21c.

Cheese—Receipts 2,392 pkgs.; market strong; state full cream, fancy small colored, 12¼c; small white, 12¼c; large colored, 12c; large white, 12c.

Eggs—Receipts, 9,128 pkgs.; market strong; state and Pennsylvania, fancy mixed, 24@25c; seconds to firsts, 20@24; western extras, 24c; western thirds to seconds, 17@21c; western firsts, 23c; refrigerated, 19@21c.

NEW YORK MARKET.

NEW YORK, Sept. 26—Butter—Receipts for the week, 43,258 packages.

Exports for the week, 1,550 packages.

Trade during the last two days has been more quiet owing to the advance in prices and the withdrawal of considerable lots of freezer butter stored in July. During the early part of the week trade was good, fancy creamery cleaning up quickly at full prices. We quote:

Creamery, extra, 21½c; medium, 19½@21c; poor, 18@19c; Dairy, extra, 21c; medium, 18@20c; poor, 15@17c.

Cheese—Receipts for the week, 38,719 boxes. Exports, 8,992 boxes.

This has been a week of considerable activity among the trade, higher prices having been paid in the country. This caused a firm feeling, and the market closes with prospects of higher prices for the coming week. We quote:

Full Cream, extra, 12c; medium, 11@11½c; poor, 7½@9½c.

Eggs—Receipts for the week, 42,789 cases.

The market advanced one cent per dozen early in the week, receipts not having been enough to supply the current demand. All grades firm. We quote:

New York & Penn., strictly fresh, per doz, 24@25c; Southern & Western, strictly fresh, 23@24c; all sections, poor to good, 19@23c.

BALTIMORE MARKET.

BALTIMORE, Md., Sept. 24.—Butter—Since our last report there has been quite a falling off in the general recipts of butter, especially creamery. Toward the close of last week there was quite an improvement in the demand, and particularly for local consumption. The cooler weather prevailing has proven quite a factor in causing many of the summer tourists to return to their homes, these in connection with the visiting Odd Fellows and their families have swelled the population no little, hence the increase in the demand. Extras—The supply for the present is about equal the requirements. Firsts, while in fair recipt have proven insufficient for the demand. Seconds are in full supply; Imitation creamery is in light receipt, there is a fair demand. Ladles—The supply is equal to the demand. Packing stock is meeting with a fair demand. Blocks and Ptints—All choice to fancy stock meets prompt sale. At the close of today's market there was a healthy feeling, and all desirable stock was firmly held at the recent advance.

Creamery Separator, extras, @22½c; firsts, 21@22c; seconds, 19@20c. Imitation Creamery, extras, 20c; firsts, 18@19c; seconds, 15@17c. Iowa & N. W. Va. firsts, @13c; seconds. 12@12¼c. Creamery blocks (2 lbs.) extras, 23@23½c; firsts, 21½@22c; seconds, 19@21c. Creamery 'prints' ¼ lb.) extras, 24½c; firsts, 23@24c; seconds 19@22c. Md. Va. prints, extras, 22@23c; firsts, 20@21c; seconds, 18@19c. Renovated Butter, extras, 18c: firsts, 17c; seconds, 15@16c.

Eggs—With continued light receipts of strictly fresh eggs, and a brisk demand at 25 cents, the market to-day presents a healthy appearance and closes firm quite active on all desirable stock either fresh or storage.

Cheese—Receipts fair; demand good; market rules firm and active at the advance.

N. Y. State—Cheddars, fine, 11½@11¾c; choice, 11¼@11½c; fair, 10¾@11c, Flats, fine, 11¾@12c; choice, 11½@11¾c; fair, 11@11¼c; Small, fine, 12½@12¾c; choice, 12@12¼c: fair, 11½@11¾ Ohio Flats fine, 11¼@11½c; choice, 10¾@11c; fair, 10@10c½; Ohio Picnic, fine, 11¾@12c; choice, 11¼@11½c; fair, 10¾@11c; Swiss cheese, (domestic) new, fine, 13@13½c; choice, 11@12c; fair, 10@19½c.

PRIZE WINNING BUTTER

De Laval Made as Usual

The reports from the different State Fairs now being held show the almost universal use of DE LAVAL machines in the making of the very finest quality of butter, just as for fifteen years past.

A few of the most important returns received within a few days are:

NEW YORK —E. F. ROWLEY, Kennedy, N. Y., - - 98%
IOWA— — —C. D. ELDER, Manchester, Iowa, - 98¾%
WISCONSIN—A. V. GROW, Whitewater, Wis., - - 98½%
MINNESOTA—L. LOHNBAKKEN, Butternut, Minn., - 97¾%
SIOUX CITY—M. Sondergaard, Hutchinson, Minn., 98¾%

The separator does not make the butter but it has much to do with the condition in which the cream goes to the buttermaker, and it is in this, as in every other feature of separator practicability, that the DE LAVAL machines are so markedly superior.

A DE LAVAL catalogue—to be had for the asking—will make plain the difference between separators.

The De Laval Separator Co.,

Randolph & Canal Sts., CHICAGO.
1213 Filbert Street, PHILADELPHIA.
9 & 11 Drumm St., SAN FRANCISCO.

General Offices: 74 CORTLANDT STREET, NEW YORK.

121 Youville Square, MONTREAL.
75 and 77 York St., TORONTO.

For Sale—Good cheese factory and machinery in Outagamie county, Wis. 6000 lbs. milk daily. Inquire of FRED HADLER, Route 3, Appleton, Wis. 30-tf.

Very Low Rates to Denver, Colo.—Via the North-Western Line. Excursion tickets will be sold Oct. 4 to 8, inclusive, with very favorable return limits, on account of annual convention of Brotherhood of St. Andrew. Apply to agents Chicago & North-Western Ry. 33-2

Very Low Rates to San Francisco and Los Angeles, Cal.—Via the North-Western Line. Excursion tickets will be sold Oct. 8 to 17. inclusive, with very favorable return limits. on account of convention of American Bankers' Association. Apply to agents Chicago & North-Western Ry. 33-4

Note and Comment.

Pittsburg Milk Producers—The Present and Future of Dairying in Nebraska.

ED. HOARD'S DAIRYMAN:—From Pittsburg, Pa., to Lincoln, Neb., was quite a long step and worth note, from the contrasts presented.

At Pittsburg, I attended a meeting where there was a general outpouring of the farmers who supply that city with milk. They came to confer together and, with a union of loyal members, to demand from the dealers a price that will bear some relation to the retail price in the city; and to insist that purity, and healthfulness shall be maintained from stable to consumer; that the Health Officer take an active part and fulfill his duties to the extent of the law,—not that there are great violations, but to the end that confidence shall be re-established and maintained, and the demand for milk promoted.

When, a week later, I reached Lincoln, a queer state of affairs was on exhibition. The food commissioner of the state had arrested several milk peddlers and dealers for selling milk with .2 per cent fat test, as whole, new milk; and using formaldehyde as a regular thing in keeping it sweet. The strange part of the proceeding was that the Mayor of Lincoln was the chief and active attorney for the defense of the milk dealers, and so so far has cleared them, on the ground that putting preservatives into milk does not, under the law of the state, constitute an adulteration, and there is no law against using preservatives.

The city has a milk ordinance against adulteration, which has the word unwholesome milk, and under this clause, the Health Officer proposes to move, but there seems to be a great lack of cooperation and agreement between the chemists and officials of the city, the state, and the state farm. The Health Officer avers, in print, that he has been aware of the use of formaldehyde in city milk for two years, and knows it to be deleterious, but strangely, has not moved upon the enemy's works. It is a matter of comment by many that the Mayor of the city, when the trials come on under the city ordinance, will act as an attorney against the enforcement of the city's law against unwholesome milk with the formaldehyde brand. Surely, this is a strange position for a Mayor!

About the first sign that met my eye, as I left the Lincoln depot, was "The Beatrice Creamery Co." on the front of a huge, four story, brick block, and the most notable sight, was a lot of men "settting in," car loads of cream in 85 pound cans which had come in from the late indian, and buffalo country. "That's the largest creamery in the world," said my guiding friend, as we walked along in a wind that threatened to "hold me up" every minute. "They make two full car loads of butter a day there. In July they made 21 tons a day."

That statement and the wind together took my breath metaphorically, and threw me down, for it must not be forgotten that this is a place where 45 years ago, both indians and buffalos roamed without let or hindrance.

In due time we visited this great creamery and were shown its workings. It seems incredible that in six years it has grown from very humble beginnings to have now almost 7000 patrons, and in the best of the season, receives nearly 2000 cans of cream daily, that makes more than twenty tons of butter. It started out as a gravity cream-raising concern; then it changed to the skimming station system, but is now, with a few minor exceptions, a farm separator institution, and has in the past year put out from this office alone, about 4,000 hand separators. The skimming stations are turned into cream gathering "centrals," and new territory acquired, until now the the cream comes in from stations 400 miles away. And these are being daily added to, for in the last ten months, the business has increased fully sixty per cent and has outgrown the Lincoln terminal, which is to be immediately greatly increased in size, and a sub plant established somewhere in Colorado.

The resident managers, Messrs. Priest, Hascall and others, were very cordial, and I was taken from "turret to foundation stone," and every part of the workings of the plant exhibited. The serious thing to contend with is the farm individuality of the cream and the time that must elapse before the cream from Scott's Bluff Co. can reach Lincoln. To say that some of it is actively sour, ripe does not express it, is to put it mild. Fully half of the cream needs strenuous pasteurization, and the large Farrington Duplex pasteurizer was going full speed limit, warming up 125 cans of cream per hour to 185° and as rapidly cooling it to 45°, at which temperature it is held for several hours to regrain, or crystallize—whatever it is called. Of course cream must be graded, and it was a great sight to see the 1,000-gallon cream vats far up aloft with their fat contents being made ready for the churn, and then down in the basement to see the huge churns revolving this cream into butter, and note the great masses of it which were being transferred from churn to table-like platforms, where it was being moulded into every form and kind of pat, brick, package, box and carton yet invented, to fit and meet every kind and condition of southern and western markets.

"In June we made 1,260,000 lbs. of butter, July, 1, 200,000 lbs., and in September we will make 700,000 pounds easily, and as a dairy state Nebraska has only just commenced," says our matter-of-fact guide.

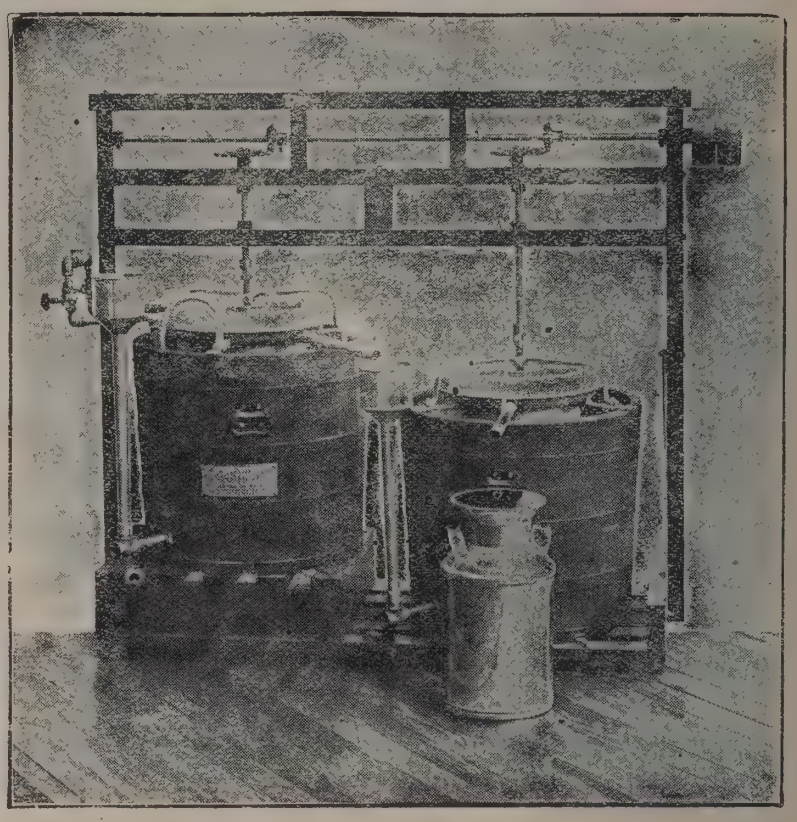
True, but as we go about, we almost wonder how this farmer is finding so much butter fat. The strictly dairy cow is only met with now and then. "The cow that is making this butter," we are told by the manager, "is a stockman's cow that was brought up to raise a calf. They are milking her now and feeding the calf skim milk. This cow only gives milk a few months at the best. She knows little about dairy barns, or balanced rations. A straw roof with barb wire siding, is her average inheritance. We want dairy cows and dairymen out here, and we are going to have them."

Yes, Nebraska will in time be a great dairy state, but it needs to have a wide distinction drawn between dairy cows and beefers with dairying as a side issue and a thing to be avoided when other farm work is supposed to be pressing. Some of the frontier counties seem to be already awake to the merits of the cow, and have placed the dairy first in importance. One county, out towards sun-set, a county with less than 1,600 inhabitants, will this season sell this one company $35,000 worth of butter fat, and other new counties are doing nearly as well. There are natural factors in abundance in favor of Nebraska as a dairy state. She has a rich soil in which all grasses thrive, with corn crop galore. The prairie grass, blue stem, black root, and the like grasses are all fine foods. Alfalfa is to revolutionize the stock industry. It grows everywhere, is the hope of the irrigated districts, and the reliance of the stockman. Close under the surface is an abundance of water, pure and free of mineral matter.

The west promises a market faster than the production can supply. Give Nebraska a dairy education, and—well, we in the east will see in her butter crop a real "yellow peril." JOHN GOULD.

Lincoln, Neb.

An Able Dairy Farmer's Wife.



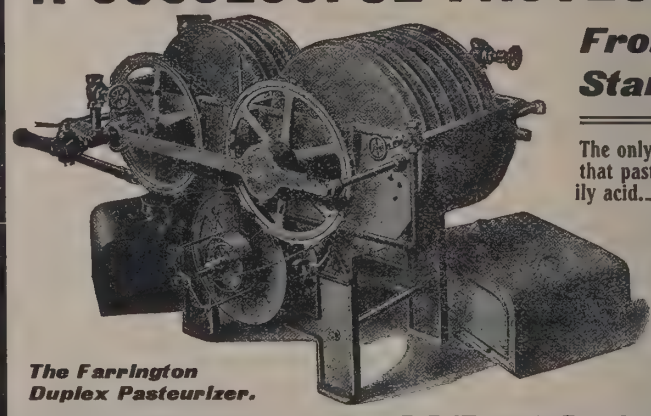
It is a good thing to be a very successful dairy farmer as is H. D. Griswold of West Salem, Wis., the man who made 20 grade Guernsey cows, last year, return over $100 apiece in cream alone. The brain equation shows in all Mr. Griswold's work as it should in every dairy farmer's work. But that is not all. Mr. Griswold is fortunate in possessing a very bright, intelligent wife. That is a lucky thing for him. We suspect that therein is the hiding of his power. Who shall estimate the force, the far-reaching influence upon the fortunes of any man of a good, loyal, keen-witted wife? "Her price is above rubies."

But we will let our readers peruse the following address which Mrs. Griswold gave at a public reception a few weeks since at West Salem. The title of her remarks was:

THE FARM, THE FARMER AND THE FARMER'S WIFE.

The farmer has never found his fields Elysian. We read and hear of an earthly paradise and sometimes think that we, or our neighbors, have found it, but it takes but little time to dispel the illusion. The sentence passed upon our first parents has never been revoked, and by the sweat of sombody's brow must man still eat bread. To ordinary mortal vision, it it would seem better that man should

A GREAT SUCCESS.



The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

reap that which he sows, but when he has carefully prepared the ground and put therein good seed, whence then should it have quack-grass, wild mustard, pigeon-grass, poke weeds and purslane? In what witch cauldron did Nature brew the army-worm, potato bug, chinch-bug and cut-worm? On what floating breeze come the microbes that produce hog-cholera, milk fever, mange, heaves, lump jaw and lock-jaw?

All men are dependent on the forces of Nature. The sunlight warms and woos, the breezes cool and purify, the storm cloud is a benison of good, or a demon of destruction, but no man is so directly dependent as the farmer. To him the weather means much, and Dame Nature holds his fortune largely in her hand. Nor is this all, for like other men he must encounter competition in the form of adulterated food products and bogus imitations; ever and always, also, there lieth in wait for him the man who walketh up and down the earth selling stock food, fruit trees, lightning rods, cord als, egg-producing and lice-destroying powders, dictionaries, p'anos, or axle-grease, not to mention the man or woman who would "like to have you have your picture enlarged."

But this is only one side of the picture. On its canvas are the growing crops, the cattle upon a thousand hills, and, in spite of rain and drought and frost, out of the womb of the morning comes the sunshine, the dew drops and the dancing leaf, for Nature is still as bountiful as when "the morning stars sang together" and "all the sons of God shouted for joy."

But is the farmer alone a child of destiny? Has the tradesman no cares? Is his brow always smooth and his step always elastic? Has the banker always a normal pulse, a good digestion, and can he woo sleep at his will? Has the physician any time he can call his own? Is he not often the object of undeserved criticism, and does he not often see patrons clothed in purple and fine linen, whose unpaid doctor bills would clothe his family? Is not the mechanic the victim of the trades-union and the walking delegate? A man may enter the politicial arena and serve his country, his God and his fellow man, but his faith in each will be sometimes sorely tried, though he himself come forth unscathed and uncorrupted.

Rapid railroad transit, the telephone and telegraph, inter-urban railways, and the newspaper, with the free delivery system, have all brought the country nearer the city. Our splendid school system, manual training and cooking schools have done much to influence popular thought.

The public press is also an educator, and through it people living in the rural districts, may keep informed of current events, and hear within twenty-four hours the latest news, whether it be the death of the head of the great Roman Catholic church or the birth of an ex-president's last baby.

Of the farmer's wife I have little to say. Her interests and those of her husband are, or should be, identical, and she is wisest who keeps herself in full touch and sympathy with his affairs. The breeze which blows prosperity to him, blows the same to her, and to the home more comforts and luxuries; but blow high or blow low, she trims her sails to meet the wind.

In essentials there should be unity, but there are a few minor affairs in which they do not always sympathize, and one of these is dress. The love of beauty and comeliness is inherent in woman's nature, and it is a trial to her oft-times that her husband's business compels him to wear plain and often patched and soiled clothing. When she visits the city or village she meets men, not superior to her husband in intellectual or moral worth, dressed in fashionable and becoming clothing. She sees little boys on the street with hardly enough to do to keep them out of mischief, in jaunty caps and neck-ties, and comes home to find her liege-lord and her offspring arrayed in the prevailing blue or brown denim, becoming to neither face nor figure. It does give her a little thrill of pain, for is she not sure that if her husband had on the minister's clothes he would be a handsomer man than the minister? And if her sun-browned boy wore the clothes of a prince, he would look a very prince himself? Blame her not, she can't help it!

Another trial also is that everlasting business commonly called chores. If work could only close at supper time, it were well; but after that there is a season more or less protracted, that seems to belong to neither night nor day, but a kind of twilight exercise, and one which so uses up nerve and muscle that there is little inclination to dress up and go out to spend the evening afterward. To array himself in starched linen, best clothes and tight shoes, after completing the chores, requires powerful attractions and often much coaxing and cajoling on the part of the wife. The young man, whose sweetheart is waiting, will do it and count it no sacrifice, but the man whose sweetheart is by his own fireside, would fain abide at home with her there and let society, with all its allurements, enjoy itself without him. CARRIE P. GRISWOLD.

Economy in Production.

A Short-Sighted Criticism.

ED. HOARD'S DAIRYMAN:—I am at a loss to understand why you can waste your own time or space in your valuable paper upon such bald nonsense as makes up the article on page 674 headed "Economy in Production" and signed, C. L. Gates, Bellefonte, Penn. I read the article carefully from start to finish, with the hope that as $15,000 of the hard earned money of the tax payers of Pennsylvania had been expended upon the apparatus used in these experiments, I could discover some germ of practical sense that would benefit the farmers and dairymen of our state in their efforts to reach useful results in the very important matter of Economy in Production, but I can find only the veriest bosh. I will be glad if C. L. Gates will extract something from his long article that a plain farmer could use in solving this most useful problem which is constantly staring him in the face. If this paper of Mr. Gates is a fair sample of the work of our experiment stations, it is quite time a halt is called in the most extravagent expenditure of the people's money on these stations. JACOB PRICE.

West Chester, Pa.

The DAIRYMAN'S opinion of the article referred to by Mr. Price, and of the experiments being carried on at the Pennsylvania State College, with a view to determine the actual nutritive value of feed stuffs was given on page 688. Mr.

The value of a food for producing weight is determined by its digestibility. You frequently see one animal become thrifty and fat on a ration on which another continually declines. The fault is due to digestive differences. Dr. Hess (M.D., D.V.S.), by combining his practical experience as a stock feeder with twenty years of study and practice of both human and veterinary medicine, has given the world an absolutely scientific preparation which provides for this very condition. Dr. Hess Stock Food is not a food ration, but a medicinal tonic and laxative, a doctor's prescription for calling into healthy action every organ in the animal body. If the medical and veterinary colleges know of nothing better, it must be good. No unprofessional manufacturer can equal it. It keeps cattle up on their appetite to the very last day. It expels worms and produces the sleek, glossy coat, that finishing touch that commands the fancy price.

DR. HESS Stock Book Free

A treatise on the diseases of stock and poultry, written by Dr. Hess (M. D., D. V. S.), sent free to any address on receipt of answer to the following questions: How much stock have you? (number of head of each kind). What stock food have you used? Mention this paper.

Prof. W. S. Goss, Dean of Talladega (Ala.) College, says of it: "I think Dr. Hess' book a little gem. I shall keep it near me for reference."

Dr. Hess Stock Food

rapidly forces the development of solid flesh and fat, and gives greater milk capacity to a cow. Keeps cattle, horses, hogs and sheep in perfect condition.

Information Bureau.—For any disease or condition for which Dr. Hess Stock Food, is not recommended, a little yellow card enclosed in every package entitles you to a letter of advice and a special prescription from Dr. Hess (M. D., D. V. S.) In this manner you are provided with a universal treatment for all stock diseases, either in the Stock Food itself or in the special prescription to which the little yellow card entitles you. Indorsements from physicians, scientists and stock feeders furnished on application.

Dr. Hess Stock Food is sold on a written guarantee, 100 lbs. for $5.00 (except in Canada and Pacific Slope); **smaller quantities at a slight advance. Fed in small dose.**

DR. HESS & CLARK, Ashland, Ohio.

Also manufacturers of Dr. Hess Poultry Pan-a-ce-a and Dr. Hess Healing Powder.

Instant Louse Killer Kills Lice.

A BUSY HEN is a profitable hen whether she be laying, hatching or taking on fat for market. Nothing will aid so much in all of these occupations as small daily feeds of **Prussian Poultry Food.**

It not only helps in eggs, growth, etc., but also prevents and cures **gapes, cholera, roup** etc. and helps **in moulting.** "I have tried the Prussian Poultry Food for roup and it cured my flock. For keeping poultry in condition, and especially as an egg producer, it stands without an equal. Every one that keeps poultry ought to give it a trial and be convinced."—B. H. PAYNE, Painesville, Ohio.

Price 25 and 50 cents. If by mail, 40 and 75 cents, Pails $3.50. Ask your dealer. If not there, write us. We will see that you are supplied and send you our **68 page book free.**

PRUSSIAN REMEDY CO., St. Paul, Minn.

The Best Cow

you ever owned would be a better cow both in general condition and milk yield if fed a regular ration of

Alma Dried-Molasses Beet-Pulp

When pasture is insufficient or altogether lacking this Food supplies just the needed elements to maintain the maximum yield of milk. It is better than bran and costs less.

Let us send you our printed matter which tells how careful we are to have it proportioned just right and absolutely clean. See, too, what others think about it.

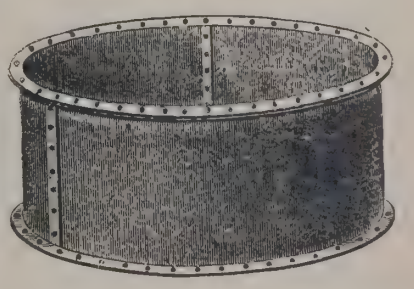
Alma Dried-Molasses Beet-Pulp is unlike many patent "stock-foods." It is a natural product and contains no drugs or other injurious ingredients.

Sanitary Milk Co., Grand Rapids, Mich., writes: "Send a second carload. We find it as a milk producer better than bran."

If you are feeding stock for the market you will find **Alma Dried-Molasses Beet-Pulp** fed with grain the best fattener, because it increases the appetite, aids digestion and assimilation.

Do not confuse this with wet beet pulp which freezes and ferments, or with common dried pulp containing no additional sugar. It takes 16 tons of wet pulp to make one ton of our Food and it keeps indefinitely. The genuine Alma Dried Molasses Beet Pulp contains 72 times as much sugar as wet pulp, and nearly 5 times as much as common dried pulp.

Write to-day for prices, directions for feeding, analysis by U. S. Government expert, etc. Address



Dept. 6, Alma Sugar Company.
Alma, Michigan.

Price, in his criticism, falls into the quite too common error, of wanting to plant his seed one day and harvest results the next day. It takes time to work out dependable scientific conclusions, just as it takes time to go into a forest and clear up a tillable farm, or to select a route and construct a railroad. Agricultural science in all its branches, and especially that one which embraces the successful and economic feeding of farm animals, is yet in its infancy. We have learned some things by experience, but the Editors of this paper are painfully aware that there is much more to be learned, and they look to Prof. Armsby and his Respiration-Calorimeter apparatus to solve some of the perplexing problems which are now constantly presenting themselves.

Hand Separator Cream.

ED. HOARD'S DAIRYMAN:—Judging from what I read and hear in regard to the hand separator system of cream gathering, the general impression prevailing is, that the cream will have to be gathered every day or every other day anyhow. Now it is certain that there are thousands of small dairymen who will never buy a separator if they have got to make the daily trip to the station, and if they would, the creamery could not afford to ship it, for the charges are the same for two or ten gallons. But if the cream can be held from three to five days, the trouble above mentioned will be largely if not entirely overcome, and the farmer with the small herd will have a chance to grow a large one, and that is what we are much in need of here as elsewhere.

We have been handling hand separator cream from individual shippers since last April, having therefore passed through the hardest season for the milk or cream business. My experience leads me to say that the success of the system lies almost or entirely in the skimming of a very heavy cream. We are buying whole milk also; we have one patron who hauled to us for three or four years, and if in that time he brought in one good lot of milk, it was a mistake on his part. He moved so far from the factory that he could not haul it, so bought a hand separator, and we are getting from him 10 gallons of 40 per cent cream every fourth day and it is very nice cream; above the average.

Of course the reasons are apparant to anyone who will think. The separating is done immediately after milking, the cream being very heavy and a small amount of it is easily taken proper care of, and if properly cared for, will keep 3 or 4 times as long and well as light cream. We have another patron who takes good care of his milk. He was shipping 40 per cent cream every otherday, of finest flavor. He broke his separator, borrowed one, couldn't skim better than 21 per cent; shipped every day; couldn't use the cream at all; got his separator fixed; skimmed heavy again; shipped when he got a can full (2 or 3 days); flavor O. K.

Some of our patrons continue to skim a light cream; they are the only ones from whom we get cream that is off flavor, and it is a fact that some of these same patrons are taking better care of their milk and cream than others who skim heavy and whose cream is O K on flavor. Also the skimming of heavy cream leaves the skim milk where it belongs, on the farm, and saves shipping charges which is a saving for the farm also, for it comes off the price of the butter fat. Have just received three lots of cream testing 40%, 34% and 22%. The gentleman who wrote on this subject in last week's DAIRYMAN would certainly have to grade them extra, 1st, and 2nd. The 22% cream was only 2 days old and had a sharp, vinegar sour. The 34% was nice, but the 40% was just turning and a most excellent flavor and had been held five days.

Briefly put, our experience is, that during the past summer we have not had one lot of heavy cream (38% to 52%) but what any good judge would call very nice and most of it firsts, and we haven't had one lot of light cream, say, 20% to 30%, that any one would call nice. I suppose the first thought of the reader will be, do I know what good cream and butter is, the answer to that query is, try it and see, that is, the heavy cream.

I might add, that our butter has retailed at 30 cents per pound all summer on the home market, a city of 25,000, and

FRED STUBLEY, Black Earth, Wis.

the demand has always exceeded the supply. Now, my reasons for writing are twofold: First, this hand or farm separator system is in its infancy, and we all have very much to learn, so let us all turn on the light of our experience, Second, I have gotten much from the DAIRYMAN and its readers, and I want to give what I can in return. Following is our card to patrons:

OUR MOTTO.

Clean and cool from the cow to the consumer.

HOW TO HANDLE CREAM.

Set cream screw to skim as heavy as it will run from the machine; thus saving skim milk, express charges and labor. Separate as soon as through milking; cool cream immediately, then mix it well with what you have on hand; never mix warm and cold cream. Keep in a cool, clean place (a well is best) cover top of can with cloth, never put tin top on till ready to ship.

Clean your machine and all pails, strainers, etc., as soon as through separating. *Never use soap.* Rinse off with luke warm water, then use hot water with a little sal soda in it, then finish with boiling water or steam. "Eternal vigilance is the price of liberty" or any good thing, especially good milk, cream and butter.

EDWIN PATTISON.

Bloomington, Illinois.

Indiana State Dairymen's Meeting.

ED. HOARD'S DAIRYMAN:—The Fourteenth Annual Convention of the Indiana State Dairy Association will be held at Plymouth, Ind., December 10, 11, 1903.

Plymouth is in about the center of the north quarter of the state, a section in which about one-half of the Indiana creameries are located, and in which several new ones have been started within a year or two. A great deal of milk is produced in the western part for the Chicago market.

Plymouth is on three lines of railroad, making it easy of access from all directions, and local trains run at convenient hours.

A good program is in process of preparation which will include prominent speakers from this and other states.

Prizes will be offered for creamery and for dairy butter, as well as for cheese.

The merit of the essays received last year prompts the repetition of the following offer:

To the person residing in Indiana, presenting the best essay, as a result of his or her own work, on the cost of producing milk, butter fat, or butter, a prize of $10.00 will be awarded; and to the writer of the second best $5.00.

Essays should be written on one side of the paper only.

The writer's name should accompany the essay on a separate piece of paper.

Essays should be in the hands of the secretary before the opening of the first session of the convention.

Suggestion: As a cow must be maintained a year, whether she is producing or not, it is suggested that where it is possible to know of the year's production either by home records or the creamery where the milk may be delivered, and to make an accurate estimate (by weight if possible) of feed and pasture consumed, it is the most desirable basis for figures. Though the shorter the period the more accurate the figures may be because of the practicability of getting actual weights for a short time for the whole. The evidence the essay bears that the writer knows accurately whereof he writes, rather than guessing at what was or might be done by his herd, will have much weight in making the award.

Applications for entry blanks and programs may be addressed to the Secretary, H. E. VAN NORMAN.

LaFayette, Ind.

Mr. Wheaton's Canadian Dairy Notes.

Canadian Fairs—A Large Cheese Exhibit—The Prize Winners

ED. HOARD'S DAIRYMAN:—The big fairs here of 1903 are now events of the past. In the main they have been the most successful exihibitons ever held in Canada. Especially is this true of the Dominion Exhibition held at Toronto, during the first two weeks of September. Never on this continent has a better show of live stock, at an annual fair, been seen. There were nearly 1300 horses on exhibition, with a high average of excellence in quality, especially in the heavy draught classes. The show of Short-horns was worth going a long way to see, While no very brilliant individuals were shown, the general average was ahead of anything ever seen in Canada, which is saying a good deal.

In the dairy classes a splendid array of those great benefactors of mankind, the dairy cows, faced the judges.

If we take the Dominion Exhibition as a criterion, the Ayrshire is the most popular dairy breed in Canada. This favorite of the Lowlands of Scotland, was out in strong force, with some splendid dairy types among its numbers. Next in order came the Holsteins, with a lot of animals which, for high average of excellence, would be hard to beat in any showing. Those splendid butter producers, the Jerseys, also made an excellent showing, with several individuals of high merit.

The Guernseys, though few in number were of high quality. In fact all along the line no inferior individuals were to be seen, simply because there is no use in bringing anything else to a great show of this kind.

A new class this year was that for grade dairy cows. Many of the breeders fought shy of this class, and consequently only comparatively few grades were shown. It will be different another year, and we look for this being one of the strongest classes in the show. And why should it not be? The grade dairy cow is the average farmer's cow, and our exhibitions will render a signal service to their country by encouraging the finest types of this class to come within the show ring.

But while the live stock at Toronto this year could not be passed by without some special attention, the display of dairy products must claim the greatest amount of attention. Never in the history of Canadian dairying has a better all-round exhibit of butter and cheese been gathered together. It was a revelation to many an American visitor, while those who had the privilege of sampling the various exhibits pronounced the quality as being of the best.

Thanks largely to that sturdy champion of Canadian dairying, Mr. A.F. MacLaren, M. P., who for the past few years has been a director of the Toronto Exhibition, our dairymen have one of the best equipped dairy exhibition buildings on the continent, if not in the world, in which to display their products. It is equipped with a refrigerating plant, and has every facility for displaying exhibits to the best advantage. The main part of this building was in use last year. Since then, through the liberality of the Ontario Government, a large amphitheater has been added, in which butter making competitions and demonstrations in cheese making are carried on, and lectures given every day by experts and others on practical and timely topics. This theater will seat about 1,200 people and was crowded to the doors every day while the lectures and demonstrations were in progress. The dairy building this year was in charge of Mr. F. J. Dillon, favorably known to many readers of the DAIRYMAN.

In the cheese section over 500 cheese were on exhibition, representing fully 200 different factories. Of these factories, 13 were from outside Ontario, 7 from New Brunswick, 3 from Prince Edward Island and 3 from Quebec. The judges, Mr. J. A. Ruddick, chief of the Dairy Division, Ottawa, and senior instructors Publow and Barr, pronounced the quality to be uniformly good throughout. The chief defects were in the flavor and texture, many cheese showing more openness than is usual at this season of the year. These defects were largely due to bad milk, and unsanitary condition of the factories. The same cheese showed the effects of too high curing, due to badly equipped curing-rooms.

All the prizes went to Ontario makers, though some outside lots scored enough points (95) to secure a medal. The New Brunswick and Prince Edward Island cheese, while rich in quality, were too green and scored lower in flavor and texture. The Quebec cheese also scored lower in flavor, and, while rich in quality, were a little weak in texture.

The chief interest centered around the syndicate prizes. These were given to the syndicate instructor whose factories made the finest exhibit of cheese and to those having the factories scoring the highest average in the regular classes. Mr. W. H. Morton, instructor in the Tweed section in Eastern Ontario, won first in both these sections, and one of his makers, Mr. C. Chambers, Fluerton, won the challenge trophy. The second prize for the best collection went to Instructor McKay, of St. Mary's and second for aggregate to Instructor Brown of Ingersoll. The following are the awards in the regular classes, with those scoring sufficiently high (95 points) for a silver medal:

Best two factory, colored—1, J. S. Isdad, Paisley; 2, W. A. Bell, Pine River; 3, Charles Wilkins, Cornwell; 4, W. A. Anderson. No medals.

Best two factory, white—1, Mary Morrison, Newry; 2, G. M. McKenzie, Ingersoll; 3, C. A. Publow, Mud Creek; 4, Parlane Christie, Woodstock. No medals.

One cheese, best factory, colored—1, J. S, Isard; 2, J. W. Claridge, Glen Huron; 3. Chas. Atwood, Arcona; 4, A. E. Gracey, Dorchester. Silver medals, W. D. Angus, Attwood; 5, W. T. Oliver, Camlachie; 6 Geo. A, Renwick, Villiers; 3, G. M. McKenzie, Ingersoll.

One cheese, best factory, white—1, C. Chambers Fleurton (Challenge Trophy); 2, J. W. Claridge; 3, J. S. Isard; 4, A. McNair, Mill Bridge.

Medals—J. R. Almont, Simcoe; Fred H. Gould, Combermere; Chas. E. Ballard, Fort Stewart; W. F. Gerow, Napanee; W. D. Angus; E. E Diamond, Madoc; Jos. W. Johnson, Stamwood; H. S. Nix, Maynooth; Miles Latta, Thomasburg; John H, Anderson, Bancroft; John E. Stacey, Mitchell; Havelock Cheese Co., Havelock, N. B.; Geo. W. Chambers, Eldorado: G. M. McKenzie; W. Hamilton, Listowel; R. T. Gray, Queensboro; M. Morrison, Harriston; Geo. A. Boyes, Putnam; T. K. White, Drummond Center; J. L. Thompson, Hawkesville; Jos. Taylor, Campbellford; J. Dilworth, Meyersburg.

Best 3 Canadian Stillton—1, G. M. McKenzie; 2, Connolly Bros., Thamesford; 3, W. F. Gerow.

Best 2 Canadian Flats—1, C. A. Publow; 2, Mary Morrison; 3, Robt. Cuddie, Woodstock.

In butter, Quebec had much the best of the battle, carrying off the challenge trophy. It excelled in flavor and texture. The trophy went to W. H. Stewart, Fentin, Que. The following are the awards in the butter sections:

Best tub or box—1, W. H. Steward Fentier, Que. (Challenge Trophy); 2, J. G. Bauchard, St Hyacinthe, Que.; 3, Robert Ireland, Quyon, Que.; 4. Sleightholm & Rankin, Strathroy.

Best 50 pounds creamery, pound rolls or prints—1, J. G. Bauchard; 2, F. W. Smith, Beaver-

LIGHT AND DARK,

Day and night, sunshine and shadow are not more different from each other than a healthful from a sickly woman. The healthful woman carries light and sunshine with her wherever she goes.

The woman who suffers from ill-health casts a shadow on her own happiness and the happiness of others. She cannot help it. Those who suffer cannot smile and sing.

Ill-health in woman is generally traceable to disease of the delicate womanly organism. Many women have been restored to happiness by the use of Dr. Pierce's Favorite Prescription. If there is an invalid woman, suffering from female weakness, prolapsus, or falling of womb, or from leucorrhea who has used Dr. Pierce's Favorite Prescription without complete success Dr. Pierce would like to hear from such person—and it will be to her advantage to write as he offers, in perfect good faith, a reward of $500 for any case of the above maladies which he cannot cure.

"I feel it my duty to inform you that I had been a sufferer for many years from nervousness with all its symptoms and complications," writes Mrs. O. N. Fisher, of 1861 Lexington Ave,, New York, N. Y. "I was constantly going to see a physician. I was induced to ask Dr. Pierce's advice. I then took five bottles of 'Favorite Prescription.' I am not now cross and irritable, and I have a good color in my face; have also gained about ten pounds in weight and *one thousand of comfort*, for I am a new woman once more."

The dealer who offers a substitute for "Favorite Prescription" does so to gain the little more profit paid on the sale of less meritorious medicines.

Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay expense of mailing *only*. Send 21 one-cent stamps for the paper-covered book, or 31 stamps for the cloth bound. Address Dr. R. V. Pierce, Buffalo, N. Y.

THE

Iowa Dairy Separator.

AN UP-TO-DATE MACHINE
REPLETE WITH PRACTICAL IDEAS

It is built in the following sizes:

250, 350, 450, 600, 750 POUNDS PER HOUR

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

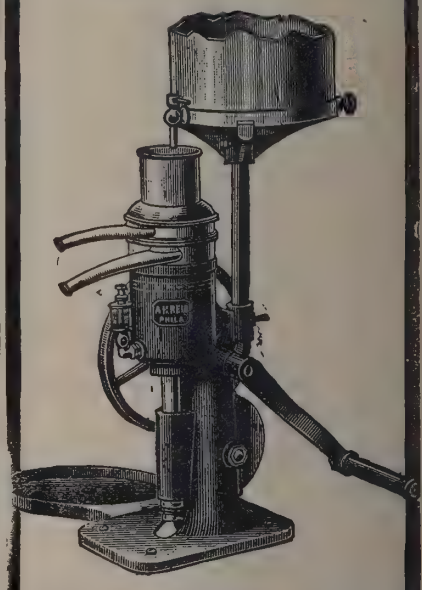
Every reader of this paper who owns a few cows to send for our new catalog of

DAVIS



Cream Separators

Sent free upon request. It will tell you why the Davis Separators are money makers for their owners.

THEY ARE GUARANTEED to separate THOROUGHLY and QUICKLY. Dairymen and farmers find the "Davis" the most economical piece of machinery on the farm. Let us send you full particulars about it

DAVIS CREAM SEPARATOR CO.
54 to 64 N. Clinton St., Chicago.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily. that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

MILK DEALERS COMBINATION Milk Protector, for cans or bottles. Prevents milk churning and souring in summer and freezing in winter. INVESTIGATE. S. C. Sullivan Mfg. Co., Erie, Pa.

ton: 3, John McQuaker, Owen Sound; 4, A. C. Reesor, Locust, Hill.

Best 40 pounds creamery, packages—1, Robt. Ireland; 2, Geo. Balkwell, Lafontaine, Ont.; 3, Sleightholm & Rankin.

Best dairy tub not less than 30 pounds—1, A. D. Delong, Elgin; 2, Miss M. Hunter, Rockton; 3, Geo. W. Gardner, Lyn; 4, Mrs. S. J. Lyons, Norval.

Best dairy firkin, crock or tub, not less than 20 pounds—1, W. B. Cockburn, Hamilton; 2, J. M. McKay, Elanbank; 3, Miss M. Hunter; 4, W. H. Phillips, Frankford.

Best basket, 1 pound prints or rolls—1, Miss M. Hunter: 2, Mrs. S. J. Lyons; 3, W. B. Cockburn. 4, D. Steward, Hempstead

The butter-making competitions were well contested, and were in charge of Prof. Dean, and Mr. A. H. McFeeters of the Ontario Agricultural College. Competitors were required to ripen the cream, make the butter and put it up in pound prints ready for shipping. The awards in this section were as follows:

Professionals—1, Miss M. Hunter; 2, Miss M. L. Green; 3, Miss H. McAllister; 4, M. R. Player.

Amateurs for farmers, farmers' wives and daughters—1, M. Stonehouse, Port Perry; 2, Miss Mabel Parkinson, Jarvis; 3, Miss Maud Parkinson, Jarvis; 4, C. E. Rogers, Dorchester.

Free for all, open to any farmer, farmer's wife, son or daughter—1, Miss M. L. Green; 2, Miss M. Hunter; 3, Miss H. M. McAllister. Judges recommended division of fourth prize money between Miss R. M. Wolfe and R. W. Burns.

Free for all, open to any member of a dairy school or person employed in a creamery—1, W. B. Cockburn, Hamilton; 2, Miss Maud Parkinson; 3, Miss Janet Stewart, Hamstead; 4, Miss Mabel Parkinson.

Before closing, just a word in reference to the splendid array of cream separators to be seen in the dairy building. Eleven different makes of separators were shown, nearly all of which were hand separators, thus showing the growing popularity of this line in Canada. Mr. Ruddick had in this building also a most instructive exhibit, showing the effects of cool curing and illustrating by chart how modern cheese curing rooms should be built.

The directors of both the Eastern and Western Dairymen's Associations met during the fair and arranged the time and place for holding their annual conventions. The Eastern Association will meet at Belleville on January 6, 7 and 8, and the Western Association at St. Thomas, on January 12, 13 and 14, 1904. It is the intention, we understand, to bring one or more speakers for these meetings from the United States.

The dairy product exhibits at the London and Ottawa fairs were superior in quality to those of other years. At London an interesting butter-making competition took place. The dairymen are asking for a new building at London, which they certainly should have if that exhibition wishes to keep abreast of the times. J. W. WHEATON.

Toronto, Canada.

Conversion Factor for Estimating Yield of Butter.

ED. HOARD'S DAIRYMAN:—Will you be good enough to give me the coefficient by which I can determine the quantity of butter in pounds, the amount of milk in pounds and the percentage of butter fat being known? G. W. N.

Dimock, Pa.

Inasmuch as butter is not a stable compound, but may vary several points in its percentage of butter fat, and further, because the losses in creaming and churning are not uniform, it is impossible to give a coefficient or factor for estimating the yield of butter from the per cent of fat in the milk, that will give results corresponding with the actual churn yield in every individual instance. But in this respect, as in so many other of the practical affairs of life, we must be content to accept the law of averages. Standard commercial butter will vary from 80 to 85 per cent in its content of fat, and the inevitable losses in creaming and churning, with the best of modern machinery and the highest degree of skill and care in its use will not fall much below 0.2 of one per cent, and this loss will be practically the same in milk of all qualities, but proportionally smaller as milk increases in its fat content.

Therefore, if we say that butter should average 82.5 per cent fat and that the losses in creaming and churning do not exceed 0.17 of one per cent, 100 lbs. of 4 per cent milk would yield 4.66 lbs. of butter, a gain of 16⅔ per cent, or one-sixth.

At the dairy test during the Columbian Exposition in Chicago, where everything was at its best, the average yield of butter from 100 pounds of fat in the milk was 117.3 lbs. It is not to be expected that the average work in the best conducted dairies or creameries can quite equal these figures, but in estimating the butter capacity of a cow or herd it is but fair to give them the benefit of the highest skill, and hence it was resolved by the Association of American Agricultural Colleges and Experiment Stations, at its annual convention in 1895, to adopt the factor 1.166+ for computing the yield of butter from the butter fat in the milk. Or, for short, add one-sixth to the total fat.

A New Use for Ensilage.

ED. HOARD'S DAIRYMAN:—One of my neighbors had a large quantity of ensilage on hand last spring when grass was six inches high. He turned his cows into a clover pasture and kept them in the yard at night, and gave them a good feed of ensilage in the morning before turning them to pasture. He reported his cows as doing well on the feed. This seems to be a very sensible way of feeding ensilage. If clover hay will balance ensilage, why will not ensilage balance clover pasture?

I do not like the new notions about feeding a balanced ration, but I find my cows believe in the new doctrine and compel me to follow the rules or change the breed of cows. This summer I took my cows from a pasture of mixed grasses and put them in a field where there was an abundance of alsike clover, and nothing else. In a few days I noticed a decrease in the quantity of milk. One winter I fed my cows ensilage and timothy hay, and they refused to pay for the feed. N. B. WHITE.

Oconomowoc, Wis.

CHICAGO oleo factories during the month of August turned out 21,668-50-pound tubs of uncolored and 691 tubs colored oleo. This is 20 per cent less than the August make of 1902 and eighty per cent less than for August 1901. For a law that is a failure this is doing very well.

HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The

DREW ELEVATED CARRIER

will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating—it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.

It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

"WATCH IT WORK FOR YOU"

WRITE FOR OUR ILLUSTRATED CATALOGUE, FULLY EXPLAINING ALL ABOUT IT.

Also receive testimonials from hundreds of farmers and dairymen who have the Drew Carrier on their farms.

He Don't Like Farm Life.

ED. HOARD'S DAIRYMAN:—I have read the article in the DAIRYMAN of Sept. 18, from Mr. H. C. R., Oneida, N. Y., which induced me to write and tell you what I think of it. I don't think there was ever an article published in HOARD'S DAIRYMAN that had more truth about it than the one from Mr. H. C. R. As far as I ever went I found things exactly like Mr. H. C. R. writes, that is, that the young people want to get off the farm as soon as possible and move to some town where they can live without work. This puts me in mind of a young lady who came on a visit from town a few years ago. When she was told that our neighbor and his son, who was 16 years old, was milking 10 cows, mornings and evenings, she said: "If this farmer was living near a city he would get arrested for making that boy help him milk 10 cows."

This shows what she thinks of teaching young people how to work, and there are hundreds like her. GOTTFRIED JOSSI.

North Georgetown, O.

CONCERNING OUR ADVERTISERS.

The Portland Mfg. Co., of 135 Pearl St, Portland, Mich, wants live men and women who desire a dignified and profitable method of making money. This can be done in any vicinity where their washing machine is not yet introduced. As an extra inducement they offer from $5.00 to $7.00 per day and expenses to commence with. Their washer is sold under a positive guarantee to wash everything from the finest linen or lace perfectly clean, even to taking the grime that is "ground in" out of the dirtiest collars and cuffs of the most soiled working garment, in one fourth the time and labor, with no injury to the most delicate fabric. It is sent on trial for 30 days. The foregoing statements are endorsed by an experience of fifteen years, during which time many of their agents have made small fortunes and are still enjoying comfortable incomes. It would be well for those of our readers who are interested to write at once for particulars.

MONEY IN CORN STALKS.

The E. W. Ross Co., of Springfield, Ohio, have issued a 12 page folder referring to the additional profit that can be made by utilizing the corn stalks of the corn crop for feed, both in the green and dry stages. Corn fodder when cured in the field loses much of the saccharine matter, but by far the greatest loss comes from the action of rain, snow and wind. In connection with this fact, when fodder is thrown out to the stock in the whole state, little or none of the stalk is eaten. How many times do we see winter pastures after two or three months of this sort of feeding literally covered with fodder uneaten and wasted? These are the conditions which many of our friends desire to overcome. We advise every farmer or dairyman who reads this to write to the E. W. Ross Co, Dept. 36, Springfield, Ohio, and get a copy of this folder and learn how to double the value of your corn crop. The folder is free—a postal card will bring it to you. Mention this paper.

There are thousands of the readers of HOARD'S DAIRYMAN that should accept the proposition of M. H. Fairchild & Bro., 199 Michigan St., Chicago, Ill., that they make in their advertisement this issue. They offer a trial of their "Dairy" a cleanser and purifier, and "Kero Germ" a disinfectant, and "Brilliant" a metal polish, if you will help pay the express. These goods are standard and have stood the practical test and made friends everywhere among creamerymen and dairymen. Every dairyman and creameryman wants something of this kind and needs it. A chance to try goods at the manufacturers expense is not often given. Don't refuse it but give the goods a trial. Read the ad headed "All Three Free."

There is an attractive advertisement in this issue of the Colonial Salt Co., Akron, Ohio. They claim to have the best butter salt made and offer a 56-lb. sack delivered, free, on request. Read the advertisement and let them hear from you.

VETERINARY.

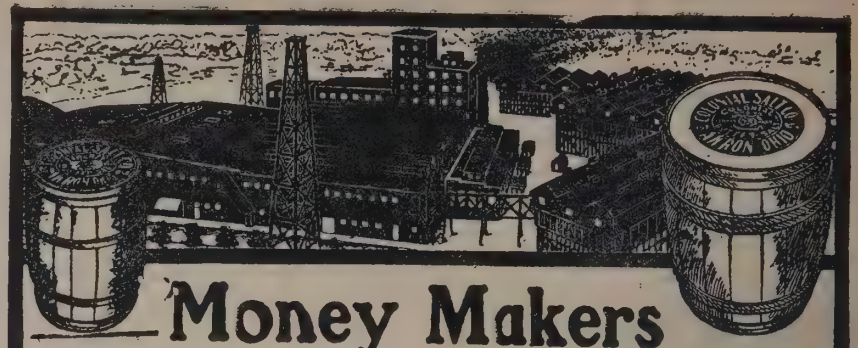
Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Partial Paresis.

I have 12 pigs about 8 weeks; 4 out of the dozen seem to have weak backs, and drag their hind parts: they have been so for 3 weeks. They are eating milk from separators and have a large run at grass. GEO. S. G.

Edinboro, Pa.

ANSWER.



The lameness is due to the partial paresis, which is usually caused by high feeding, especially if young pigs are fed freely on corn and other fat producing elements during the growing period, when the body really demands muscle and bone producing elements. You must first of all remove the cause. Then you may puncture the lumbar region on each side of the spine with a thermo cautery, making about 12 or 14 holes on each side at least an inch deep.

Organic Troubles.

We have a cow six years old, had her last calf eighteen months ago, has not given milk since last spring, and is getting poor every day, is nothing but skin and bones; eats well, chews her cud and can see nothing wrong with her.

Would a twelve months old Guernsey bull, weight 625 lbs. be too young for service? I would

A Steel Stanchion beats anything you ever saw for tying cattle. Lighter, stronger, neater. Swings on chains Not in the way when lying down. Agents wanted. Write for special terms and prices. **Jas. Boyle, Mfr., Salem, O**

Money Makers For Butter Makers

Behind "Colonial" and "Liberty" Butter Salts stands the great Colonial Salt Company plant—absolutely sanitary, modern, and cleanly

Daily output 750,000 pounds.
Storage capacity 25,000 tons.
Six salt wells 3,000 feet below the surface at our plant—the purest bed of rock salt in the country—daily capacity 400 tons of salt.
Cooper shop capacity 2,000 barrels daily.
3,000 horse power boilers.
Daily supply of coal for evaporating salt, 150 tons.
Absolutely pure water from wells 150 feet deep used to dissolve the salt.
Loading tracks under cover hold 22 cars, while switch outside holds 11 additional cars.
Three trunk lines to the plant, Erie, Pennsylvania, and B. & O., facilitate immediate shipment of orders.
Every step in the process is here done by machinery, from the brine to the salt in the package, thus avoiding any chance of impurities of any kind getting into the salt. All packages are made at the works fresh every day; all cars are packed under cover; thus insuring delivery to the consumer in fresh, sweet, clean packages not soiled in any way.
Of "Colonial" and "Liberty" brands of Butter Salt

THE FLAVOR IS PERFECT
THE COLOR PERFECT WHITE

The purity the highest known, over 99 per cent. They are the lightest salts for the same bulk that there is on the market today; dissolve quickly and evenly, do not wash out in the working nor leave the butter gritty or mottled.

"Colonial" Butter Salt (light flaky grain) and "Liberty" Butter Salt (granulated, every grain the same size and perfectly square) may be tried absolutely free of cost by all who have never used them. A 56 pound sack of either or both will be delivered free on request, in return for which you are asked to report to us your actual success with them.

COLONIAL SALT COMPANY, AKRON, OHIO.

Hood Farm Abortion Cure, dollar size, prepaid to any railroad express point in the U. S., $1.25; $2.50 size, containing four times this quantity, $2.75.

Dollar size Breeding Powder, by mail $1.15; $2.50 size prepaid for $2.75.

Hood Farm Flexible Injection Tube, for administering the Powder, 75 cents; by mail, 90 cents. Address

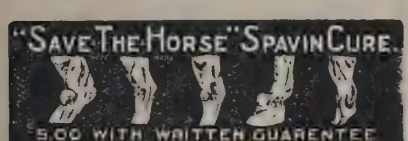
C. I. HOOD CO., Lowell, Mass.

Mention this paper in ordering.

VETERINARY PIXINE CURES

Grease Heel, Scratches and Hoof Rot,—chronic, ulcerated complicated—of the most deep seated character; Cracked or chapped teats, caked bag, cow pox and all inflammatory affections of the udder. Saddle and Collar Galls, Hoppl Chafes, and Abscesses, Old chronic Sores, the result of pressure by badly fitting harness or by irritating masses of dirt, sweat and hair under the harness. It makes a positive and permanent cure by producing healthy granulations, building up new cellular tissues, healing naturally from the bottom without scab or scar, and stimulating growth of hair, natural color. It penetrates, soothes and heals while horse works.

Absolutely Guaranteed. Money back if it fails.



2 oz. 25c; 8oz. 50c; 5lb. pkg. $4.00.

At all Dealers or sent prepaid.

Send 10c for sample box and booklet. Troy Chemical Co. TROY, N. Y.

VETERINARY PIXINE

"SAVE-THE-HORSE" SPAVIN CURE

$5.00 WITH WRITTEN GUARENTEE

It isn't words, type or page advertisements, it's the truths that ring out sound, clear and impressive—actual results from business men whose standing and reliability can be readily ascertained—which have made "Save-the-Horse" such a success. Thus cured horses are living advertisements, absolute certainties as to the possibility in your own case, with every bottle is a guarantee document as binding to protect you as the best legal talent could make it.

The fire iron invariably only aggravates the disease or injury, blistering is less effective, both necessitate laying up horse four weeks to several months. Mercurial and poisonous compounds produce irreparable injury.

"Save-the-Horse" eliminates these factors. Cures without scar, blemish or loss of hair, can apply at any time, anywhere, in all conditions and extremes of weather. Horses may be worked as usual with boots, as no harm results from destruction of hair or scalding of limb.

Positively and Permanently Cures Bone and Bog Spavin, Thoroughpin, Ringbone (except low ring bone), **Curb, Splint, Capped Hock, Windpuff, Shoe Boil, weak and Sprained Tendons and all Lameness.**

$5.00 per Bottle with written guarantee, constructed solely to protect you. Need of second bottle almost improbable, except in rarest cases. Send for booklet and copy of guarantee. If case is different than described in booklet or advertising we advise frankly of the possibility of the remedy affecting cure. Give particulars, name age, development, location of swellings, lameness, and describe way horse carries leg.

$5 00 per bottle at all druggists and dealers, or sent express prepaid.

TROY CHEMICAL CO., TROY, N.Y., ALSO MANUFACTURERS OF VETERINARY PIXINE

Clark's Tools for Large Hay Crops

CLARK'S REVERSIBLE

Bush Plow and Harrow

Cuts a track 5 ft. wide, 1 ft. deep. Connects the sub-soil water. It is an excellent machine for covering in sugar cane. Strength guaranteed. Can plow a newly cut forest, stump, bush or bog land, leaves the land true and clean for grain or any crop.

TWO SIZES. Cuts 1 or 2 bushels per minute, for fowl or beast. Gouge cutters never choke or clog. Price $7 to $15.

SEND FOR CIRCULARS.

THE

CUTAWAY HARROW CO.,

HIGGANUM, CT., U. S. A.

like to use him as soon as possible and not injure him for the future. J. A. T.

Ryan, Iowa.

ANSWER.

No. 1. Your cow has organic trouble of some kind which is impossible to locate without a personal examination. If you have more than one that is unthrifty in a like manner there may have suspicion of tuberculosis. The best advice we can give is to have a thorough investigation made by a qualified veterinarian.

No. 2. The bull is old and big enough for service, if not allowed to be overtaxed in this capacity.

Lice.

Three years ago I unfortunately bought a calf, with blue lice on it. Since then I have been pestered with them; they tell me the only way to get rid of them is to burn the buildings. This is too expensive, burning good basement buildings.

Plattsville, Wis. J. N. McL.

ANSWER.

Soak each animal to the skin with a solution of Creolin, taking 12 tablespoonfuls to each gallon of water. Be sure to apply it to every part of the body, and see that the coat is soaked to the skin. Repeat in eight days. Also thoroughly disinfect the stalls and surroundings with the same solution, and whitewash the entire inside of your barn.

Worms in Horses.

Please give me a remedy for worms in horses?

Marian Harbor, Staten Island. R. W. B.

ANSWER.

Starve the horse about twelve hours so that the bowels will not be filled with alimentary matter. Then give the following at one dose: santonin, 20 grains; Aloes bark, 7 drams; oil of turpentine, 1 ounce; raw linseed oil, 1 pint.

Abortion.

Is the solution given by Dr. Smead on page 689 of the DAIRYMAN, the proper one for germ abortion? If not, can you give a prescription that will likely do the work? I have a valuable cow that aborts within six weeks after being bred.

Salem, Ind. O. Q. T.

ANSWER.

The method of treating abortion on page 689, as recommended by Dr. Smead, is exactly what has been advocated in the veterinary columns of the DAIRYMAN for the past three years. His idea of treating the trouble by applying antiseptics directly to the seat of same is what we refer to. The solution recommended is as good as any. The preventive measures are the most important and have been referred to in these columns time and again. The writer is pleased to learn that Dr. Smead is of the same opinion and believes this to be the only true preventive and remedy for the trouble. His advice as to rearing calves is well worth the consideration of every breeder.

Warranted to give satisfaction.

GOMBAULT'S

CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

What I Know About Quack Grass.

ED. HOARD'S DAIRYMAN:—I notice quite frequently in your question department someone inquires how to kill or eradicate quack. Now if there is one thing that the writer should be conversant with it is the history of quack grass. Was reared on a farm that was covered with it and when a boy have chopped it out of potatoes and corn with a dull hoe until the back of my neck ached like an ulcerated tooth, and I wished every root and seed was ten thousand leagues under the sea. Later on, when I became better acquainted with it, it was with me as vice with Pope: "First endure, then embrace," and I have about concluded that if there was but one root on my farm and I had that root in my hand, I would plant it in good soil.

WHY I LIKE IT.

I like it because it never grows on poor soil. I like it because when, on account of poor seed or some other cause, the crop fails, Mr. Quack comes in and makes sweet pasture, or will cut a good swath of excellent hay. All kinds of stock like it and will thrive on it.

I like it because I consider it easier to get rid of than either daisies, wild mustard, Canada thistle, or almost any known, worthless enemy to clean crops.

HOW TO DESTROY IT.

There are different ways of destroying it. One is thorough cultivation. It can't stand harrowing and pulverizing in dry weather. Expose a root three days in a hot sun and it is hay. The spring tooth harrow is a bitter enemy to the life of quack roots. It brings them to the surface and exposes them to the sun and air, while the disk and cutaway harrow have a tendency to chop them up, and a quack root is like a potato, the more pieces you make of it the more seed you will have.

Take a field that is thoroughly rooted to quack and plow it in the fall, and plow it good. Don't take a 13-inch plow and turn an 18-inch furrow. If you do, you won't plow it good. In the spring when ground is dry and good shape to work, give a thorough hetchelling with spring tooth harrow, and harrow it about every two weeks until about the 20th of June, and then sow to buckwheat and when you harvest your crop in September Mr. Quack will be extinct. Or if you don't care to raise buckwheat, after thorough cultivation and same treatment, sow to clover. Be sure you have good seed and Mr. Quack will disappear. Or you may plant corn and if the season is not too wet, with the modern appliances for working in corn, you will need do very little work with a hoe.

Like almost any plant, it is harder to stamp out in a wet season than in a dry one, but thorough cultivation will keep it from interfering with any crop, and if your clover ripens and dies out, or grass crop fails for any other reason, Mr. Quack comes in, and I call him a good substitute. FRANK SHELDON.

Sandy Hill, N. Y.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

IRBYDALE Very choice irrigated acre tracts. Fine soil adapted to all products including fruit. 5 acres makes a farm that will support a family. Located in a beautiful little valley, just the place for a home. Good location for business. For information, terms, etc., address

Improved and Unimproved Farms for Sale

Farm No. 1 consists of 90 acres with frontage on a fine lake where there is excellent fishing and game. This lake is one of a chain of lakes on which you can travel for twenty-three miles. Has two-story house with eight rooms. Two-story log barn. Ice house and ten acres cleared. For sale at a bargain. One mile and a half from the railroad.

Farm No, 2. One-half mile from the railroad. 100 acres or more if desired, five acres cleared. Two-story, eight room house. Glass chicken house. First-class hog pen. Plenty of timber on land for own use, and quite a quantity of saw timber. We have besides this 16000 acres of unimproved land. Heavy black soil. All lies in Central Wisconsin. Low priced Excellent markets. Will grow any kind of crop and produce immense results. Excellent water supply. Splendid markets and a local demand for everything that is raised. None of the land lies more than three miles and a half from the railroad.

WISCONSIN FARMS

Will furnish names of people who have bought from us who have made big success. Can furnish lands in either small or large quantities. Can furnish reduced rates to see the lands. Easy terms to suit the convenience of the purchaser. As safe and desirable an investment as government bonds. Write in for maps and any information you may desire.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn, (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x2 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if defired. Price $15.00 per acre.

LAND ***Will never be cheaper than today*** **50,000 Acres** railroad and homestead. **Southeastern Saskatchewan.** Price $3.50 to $4.00 per acre, **Ten Years Time.** Prairie and timber, cattle and wheat, 1orty bu., on new railroad. Cheap Excursions. **Agents Wanted.** Write for map and full particulars. Room 810-12, Scandinavian-Canadian Land Co. 172 Washington St. Chicago

21 STRONG REASONS

WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to own a low-priced farm than to owe for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agricultural districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.

WISCONSIN BLUE GRASS LAND CO., Baldwin, Wis.

WHY DO YOU RENT LAND?

When You Can Select From The Best Wild Lands in Minnesota.

A PRAIRIE FARM in the Red River Valley at $12.00 to $20.00 per acre.
A STOCK AND DAIRY FARM in the Meadows of the St. Louis or Mississippi Rivers, at $7.00 to $15.00 per acre.
A TIMBER LOCATION WITH MEADOWS in the Millward Settlement where the timber will more than pay for the land at $8.00 to $10.00 per acre.
LANDS IN THE PARK REGION of Becker County on fine lakes.

Are you interested? Then why don't you write and learn about these opportunities? Terms are easy. Interest 6 per cent. Cheap railroad fares secured whether you buy or not, and every opportunity given to thoroughly investigate the property before buying. Railroad titles and warranty deeds. **Free Maps and Information.** These lands are offered by the Chicago, Rock Island & Pacific Railway Company, and the Duluth & Iron Range Railroad Company, through their representative,

I have lands, all good farming land, in Wilkin and Polk counties, Minnesota and Grand Forks and Burleigh counties, North Dakota, that I will sell on crop payment plan, with small cash payment of from $2.50 to $8.50 an acre cash down. Must sell. A chance of a lifetime. Investigate. For description and how to reach them, address

E. E. SECOR, Buffalo Center, Iowa

Now For Iowa.

The members of the Iowa State Dairy Association, which has suffered considerably of late years through competition with the National Creamery Buttermakers' convention, may now take courage. Its officers have the opportunity to pull off a convention in good, old-fashioned style.

After all, state dairy conventions seem to do more good than the big National meetings. The discussions get closer to the dairymen, and more benefit results to individual members. The Iowa meeting in November ought to be one of the largest and most successful in the history of the association.

Let us hope that a suitable meeting place may be selected, where there are good hotels, a prosperous and progressive dairy country surrounding, and easily accessible for the creamerymen of the state.

The dairy trade will do the rest.—*Creamery Journal.*

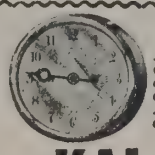
If HOARD'S DAIRYMAN may be permitted to make a suggestion, it will be this:

Let the Iowa people try a new tack. Stop making the Iowa convention merely a creamery meeting divorcing it practically from the great base of supplies—the dairy farmer. Put up a program that will take hold of the man who tills the farm, breeds the cows, produces the milk, and who is at the bottom of all the progress and profit of both creamery and cheese factory.

No finer dairy conventions are held in the United States than those of the Wisconsin Dairymen's Association. For the past two years a new feature has been added, that of the Cow Census. About two months before the date of the meeting, an agent of the Association goes to the town where the meeting is to be held and proceeds to take a close, accurate census of 50 farmers and their herds, comprehending a year's work at the creamery; the same kind of census that has been taken by HOARD'S DAIRYMAN in various states. Each farmer is told that his herd will be designated by a number. All the facts for a year are worked out, both at the farm end, and at the creamery, showing the management of each farmer, the breed of his cows, how he feeds, and how his policy of management is finally justified at the creamery.

All this data is collected and made the subject of an address by the census taker and the subject of discussion for a full day of the Convention. Long before the holding of the meeting, dairymen living adjacent thereto, know of this census discussion and their interest is greatly aroused. It is something that has a practical bearing on the actual problems at the farm end; that sheds light; that they can understand; that means a good deal to them, and they respond by a liberal attendance at the convention.

The creamerymen are interested, for the discussion touches the keynote of the whole business—the inteligence and profit of the creamery patron. We would suggest to the Iowa Dairymen's Association that they try this method in their next annual meeting. Break new ground that is just aching and groaning for the plow, and see if it does not impart new interest and life to the Association. Human nature in Iowa must be about the same as that in Wisconsin.



Average Fat for Holstein-Friesian Milk.—A Correction.

ED. HOARD'S DAIRYMAN:—In your editorial of last week in regard to the Chicago milk supply, and the folly of a ward politician, in the role of Chief Milk Inspector, holding any breed of dairy cattle responsible for the dishonesty of dealer or shipper, you are in error in the statement that "average Holstein milk tests about 3% fat;" and the point is made the more striking by comparison with some supposable average milk containing 5% fat. I am sure that it is the purpose of the DAIRYMAN to speak impartially of the dairy breeds, and that it will welcome any information in regard to any one of them.

The two most widely disseminated and popular dairy breeds in America are the Holstein-Friesian and Jersey. Major Alvord, Chief of the Dairy Division of the Department of Agriculture, gives the estimated number of living registered Holstein-Friesians as 75,000, with a valuation of $9,750,000, or $130 each; and the estimated number of living registered Jerseys as 125,000, with a valuation of $12,500,000, or $100 each. When to this large amount invested in the registered animals of the two breeds is added the unknown valuation of the unregistered pure breds and the grades, it is at once seen how far reaching any unjust stricture on either breed may prove.

It would seem that there should be less doubt as to the average per cent of fat in Holstein-Friesian milk than in that of any other breed. During the last two years alone, over 1,200 Holstein-Friesian cows have been officially tested, for periods not less than 7 days, by the different state experiment stations; and, with every milking so tested, the average per cent of fat for all the milk taken in bulk is just about 3.4%. Five Canadian Holstein-Friesian cows at the Pan-American, tested officially for a period of six months, averaged 3.26%, while the only Holstein-Friesian cow of note, which has been officially tested for so long a period as six months, gave 9,785.6 lbs. milk, containing 346.4 lbs. butter fat, an average of 3 54%.

While the five Canadian Holstein-Friesian cows at Buffalo produced more butter fat than any other five cows of any breed, their milk was below the normal in per cent of fat. Indeed, I note that it is, for the most part, the very heavy milking Holstein-Friesians that show the lowest per cent of fat; and while they may—and often do—produce a larger

PRUSSIAN STOCK FOOD

in small quantities is fed in addition to the other ration. It saves feed, conditions stomach and bowels, wards off and cures cholera and swine plague and shortens the fattening period. J. M. Klever, the great breeder, says of it:

"I must say I am highly pleased with the Prussian Stock Food. I only fed the remedy to one bunch of pigs and they were the runtiest lot I had. They scoured and were rough in hair, skin seemed to be a dry, scurvy form, (or measles is what I call it,) and blood out of shape. The remedy in a few days showed improvement, and in a short time they were coming along all right and are now the finest pigs I have. Respectfully yours, J. M. KLEVER,
Breeder and Shipper of Poland China Hogs, Bloomingdale, O."

Others commend it as highly.

Prussian Stock Food is guaranteed to give satisfaction when used according to directions. If no dealer at your place write us. Tell us how many head of stock you have and where you saw this ad and we will send you our 88 page **Farmer's and Stockman's Hand Book Free.**

50c and $1. pkg.; 25-lb. pails, $3.50

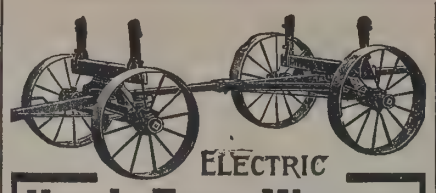
Prussian Remedy Co., St. Paul, Minn.

Manufacturers of Prussian Poultry Food, Heave, Worm and Lice Powders, Cough & Distemper Cure, Spavin Cure, etc.

amount of butter fat in a given time than the more modern milkers, they lower the average per cent of fat for the breed. I am quite sure that the breed, as a whole, averages very close to 3.5%; individual cows ranging, for the most part, between 3 and 4% fat. The change in environment from the low lands and moist climate of Holland to the higher lands and drier climate of America, together with nutritious, concentrated feed and selection in breeding, is slowly but surely increasing the per cent of fat in the milk; and the present aim of its breeders is to hold on to the great yield of milk, and at the same time increase its per cent of fat.

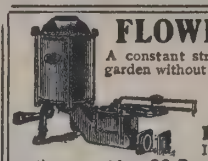
I think it is generally admitted that the Jerseys give the richest milk of any of the dairy breeds; yet I know of no official average yields for a herd for any length of time of 5%. I believe that for the 90-day test at the World's Fair at Chicago, the Jersey milk in bulk averaged 4.75% fat, while the five Jersey cows at the Pan-American averaged 4 54%. If it be admitted that Jersey milk in bulk averages 4.7%, and I should state that it averaged about 4.15%, I would not be proportionally further from the truth than was the DAIRYMAN's statement. The Holstein-Friesian breed asks no favors of any kind. It is big enough, strong enough and vigorous enough to push its own way wherever given a chance; and the dairymen who are after the dollars are its best friends. MALCOLM H. GARDNER.

Darien, Wis.



What is Cream Ripening?

This subject is discussed in Professor Conn's new work, entitled "Bacteria in Milk." The chief agency in cream ripening, according to Professor Conn, is the growth of bacteria. The bacteria of milk collect in the cream and multiply very rapidly at a temperature at which the cream is kept during the ripening. Normally ripened cream contains about 500,000,000 bacteria in every cubic centimeter. From this enormous growth of bacteria it can be easily understood why very pronounced changes take place in the chemical nature of the cream. The organisms not only consume a certain quantity of material for food, but they also produce by-products, either as excretions or as decomposition products, which vitally affect the character or quality of the cream. While it is true that there are certain chemical ferments found in milk when it is freshly drawn, and while there is no proof that these enzymes may not have a part to play in cream ripening, yet it is generally believed that the part played by these is relatively small compared with the part played by the organisms. Cream becomes acid on account of the development of lactic acid and thickens and acquires a peculiar odor, because of the presence of decomposition products; such changes are the very ones found to be produced by the growth of bacteria, and thus the general nature of the changes during the cream ripening is quite in accordance with the belief that bacteria are the primary agents in the change.



To the dairyman and the creameryman the matter of chief importance is that of keeping out of the milk or cream such organisms as are injurious to them, such for example, as are found around stables due to dust or odors, and also to the odors that might come from quarters in which the products are kept. The great activity of these organisms in reproducing themselves should always be kept in mind, so that their mere introduction is sufficient to undo the work of beneficial bacteria. Where milk or cream is sent to the creamery from the farm, too great pains cannot be taken by the dairyman to exclude organisms of all kinds, good and bad alike, because it is much easier for the creameryman to handle products of this character than it is to handle products in which are found a mixture of flavors.

Name Not Given.

We received last week a letter from a subscriber at Waitsfield, Vt., containing $1.00, to which the writer failed to sign his name. The letter contained a statement of experience in using carbolic acid for abortion. Will the writer please give us his name that we may credit the money?

"ADVERTISEMENT."

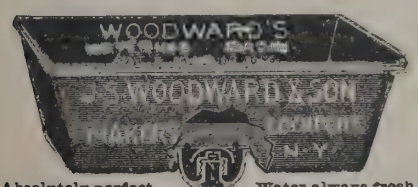
THE VALUE OF CHARCOAL

Few People Know How Useful It is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

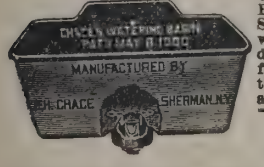


Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.



A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

Absolutely perfect. Soon pays the cost Cheapest because best.

In the article on Abortion, page 688, quoting from Dr. Smead, there is an error, we are informed, in the name of the disinfecting fluid recommended—the word "Jenner" being substituted for Zenner.

A Creamery Experience.

Ed. Hoard's Dairyman:—I saw an article in your paper of August 7 on creameries, written by W. F. McSparrin, which interested me. I was in hopes that the farmers were onto the creamery fiends' mode of operation by this time, but am sorry to hear of them still getting beaten by such swindlers who are slick fellows and no doubt find plenty of fish to bite their hooks yet.

About five years ago, some parties from the west, I think their names were Bernett & Bernett, came to Allegany, N. Y., to work their scheme for building a creamery. They used their usual mode of doing business, by going to the most influential farmer and giving him $500 worth of stock to allow his name to be used as bait for his neighbors. They then engaged the services of a druggist of the town, who about that time experienced religion in order to get the confidence of the people, for a starter for them.

They soon succeeded in selling the stock to the amount of $4,000 in spite of the fact that I showed many of the farmers the actual cost of such a building and fixtures, and proved to them that they were paying twice what it was worth; but the company had told them they were to get 20 per cent yearly on their investment and that the cheese factory had never paid anything, and they were going to wipe the cheese factories off the earth. I told them the cheese factories were here before the creameries came, and they would be here after the creameries were gone.

I said to them that in five years I would be with them just to say: "I told you so," and it has been just about the five years now. I send you a clipping from the *Olean Ledger* that will tell the story. One business man of Allegany was treasurer for the company, and I did succeed in convincing him of some things and he refused to pay the full amount over to the company, and finally succeeded in getting off about $900. But what did the stock holders do with that $900, but to take it to boost up their sales of butter by putting in a portion of it on each sale of butter, just to beat the cheese factories. But when their $900 was gone and they had to rely on the market for their price, they soon fell behind in the race and had to close up their business.

I think the best way to stop such frauds on the farmers is for the granges to take up such matters and fight to the death. Farmers have been picked long enough and unless they combine and fight, they will continue to be picked.

MY HOG WEIGHS 1100 LBS.

EASTHAMPTON, MASS., March 20, 1903.

International Stock Food Co., Minneapolis, Minn.

DEAR SIRS:—I have a large hog that was raised on your **"International Stock Food"** and he now weighs 1100 lbs. This hog is three years old and is as strong on his legs as any hog weighing 150 lbs. He is half Chester White and half Poland-China. He is still growing and every one is satisfied that he is the largest hog in America. Truly yours,

STUART R. DICKINSON.

☞We Have Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine and Unsolicited.☜

We own "International Stock Food Farm," which is located 12 miles from Minneapolis and contains 650 acres. We feed "International Stock Food" every day to all our WORLD CHAMPION STALLIONS, DAN PATCH 1:59 1/5 and DIRECTUM 2:05¼; to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. "INTERNATIONAL STOCK FOOD" ☞3 FEEDS FOR ONE CENT☜ is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human system. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these Medicines promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High-Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Fifty Thousand Dealers throughout the World. ☞Your Money will be Promptly Refunded in Any case of failure. It will make your Calves or Pigs grow Amazingly and has the largest sale in the World for keeping them healthy. ☞Beware of the many Cheap and Inferior Imitations. No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or a Falsifier.

WHAT PEOPLE SAY ABOUT THIS BOOK.

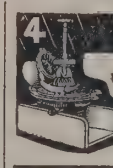
CLIMAX

Ensilage and Feed Cutters.



"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

4 HORSE and 2 Horse SWEEP MILL.

And Horse Power.

Grinds corn with shucks, rye, barley, wheat, oats and all other grains. **Self feeders. Geared 7 to 1. Light draft. Great Capacity.** (Also make plain sweep and Belt Mills; 10 sizes.)

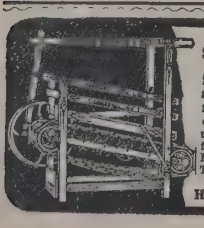
SMALLEY SAFETY BLOWER

6 sizes self feed. 12 sizes of hand feed.

Only One Belt Required.

No lost power. No danger in operation. Belt cannot slip. Every part strong and of best material. No more strain on the *Smalley* machine when Blower is attached than with the ordinary carrier. Largest size machine will easily handle ten tons of ensilage an hour, cut ½ inch and elevate into any silo. Send for 1903 catalogue, tells all about our goods. We also make complete line of drag and circle saw machines, sweep and tread powers.

SMALLEY MFG. CO., Box H, Manitowoc, Wis.



The 1903 Shredder Blades

(Patent Applied for)

make efficient shredders out of "Ohio" Feed and Ensilage Cutters. The **New Shredder Blade** is the regular "Ohio" knife with solid integrally projecting bits which cut and tear corn stalks into a nicely shredded condition, as shown in the picture. It makes corn-hay of the fodder.

Shredder Blades are interchangeable with knives on all sizes "Ohio" Cutters. They successfully reduce fodder to the proper condition and do not pulverize the leaves like other styles. **They shred** with the same power, speed and capacity as "Ohio" Cutters, and either the Chain or Blower Elevators handle the shredded corn perfectly. **Speed,** 600 to 700 revolutions. **Power,** 2 Horse Tread up to 12 h. p. Engine according to size. Let us send the 1903 catalogue of "Ohio" Cutters and Shredders. "Modern Silage Methods" 10c, coin or stamps. Manufactured by

AND THE STUCK PIG SQUEALED

The Chief Howler of the "Bucket Bowl Brigade" Seems to Hate TRUTH, and the TUBULAR Above Everything Else.

"Right Now" he is tearing his hair because we had the courage to tell the truth about the number of dairy separators actually in use. It did make his oft repeated romance about the number of old fashioned, dangerous, complicated disc separators in use look awfully "fishy," but we didn't suppose he was hugging the delusion that anyone really believed his ridiculous stories. We thought he just kept on telling such stuff from force of habit. He ought not tell yarns that are "fishy" (i. e. "discy"); then he need not be hurt by our telling the truth. We are sorry for him but

WE CANNOT STOP SELLING TUBULAR DAIRY SEPARATORS while he catches up with the procession. Farmers want the **Tubulars** because they have more conveniences, run easier, skim closer, wear longer, require less care and attention than any other separator made. We cannot afford to stop the largest cream separator works in the world from making **Tubulars** because our jealous competitor is having trouble with his "bucket full of discs." **Compare the Tubular with any other separator. Judge for yourself.**

CHILLS AND DOCTORS' BILLS
Painkiller
PERRY DAVIS
CURES THEM ALL

Short Keeping Butter.

ED. HOARD'S DAIRYMAN:—We are using a Sharples separator, churn nothing but the pure Jersey cream. We churn with a 40-gallon Fargo Baby churn. The cream is churned every other day, temperature 58 to 62 degrees, 36 to 40 revolutions a minute while churning. After the milk is drained the butter is washed with cold water, worked and salted in the churn, taken out and molded. We ship this butter to Louisville, a distance of seventy odd miles, and our customer claims it is strong when only two or three days old. Now can you make any suggestions? Sometimes the butter is oily and not grainy on removing it from the churn.

Please tell me the cause of this and why it gets strong so quickly.

We make about two pounds of butter to the gallon of cream. Is that a good average or not?. DR. W. F. P.

Pleasant Hill, Ky.

The conditions under which you are making butter must be such as to in some way cause the cream to be overripe when it is churned. I do not think that this ought to be the case if the cream is cooled immediately after it comes from the separator, to a temperature near 55° F. If you can hold the cream at this temperature and churn every other day I feel sure that the quality of your butter will improve and that no complaints will be made in regard to its being strong.

In order to produce butter of good quality it is absolutely necessary that your separator should be thoroughly cleaned, the bowl and tinware scalded each time after the separator is used, and the cream should be kept in clean, bright tinware or earthen crocks in a place where it will not absorb bad odors of any sort.

The trouble you are having is either caused by the fact that the cream is held at too high a temperature before it is churned, or some of the machinery or tinware through which it passes on its route from the cow to the churn is not properly cleaned and scalded every time they are used. I am sure you will get good results by ripening your cream at the low temperature mentioned, provided it has not been inoculated with too many objectionable germs before it is churned.

The defects mentioned as being noticed by your customers in the butter when it is one, two or three days old, are such as to lead one to believe that something must be radically wrong in either the temperature or the cleanliness used. You certainly ought to be able to make butter which will keep more than a week in a perfectly sweet condition. Your methods of churning, washing, salting and working the butter as described in your letter, ought to give satisfactory results.

The exact test of your cream can be easily calculated if you are making two pounds of butter per gallon of cream. This calculation may be made as follows:

We will assume that the butter contains 85 per cent fat; then in two pounds there will be 1.7 pounds fat. Now, since a gallon of cream weighs approximately 8.2 pounds, you have 1.7 pounds of fat in 8.2 pounds of cream. The amount of fat in 100 pounds of cream may then be obtained by the following proportion: 8.2 : 1.7 : : 100 : x. Completing the calculation, shows that your cream tests 20.7 per cent fat.

This is rather a thin cream, but the thinness ought not to have any influence on the quality of the butter made from it.

You can probably adjust the cream screw in your separator, so as to increase the richness of your cream a little. If this will not interfere with the efficiency of the skimming, I would advise doing this. A thicker cream will ripen slower than thin cream and as over-ripeness seems to be the cause of your troubles, a thicker cream may aid in improving the quality of your butter.

Answers to Dairy Questions by Prof. Farrington.

MILK SAMPLING.

I should like to get my milk tested. Would you kindly forward me directions for taking my milk samples? M. H.
New Richmond, Wis.

The taking of a sample of milk for analysis is an operation that requires the use of ordinary common sense and good judgment. Cream will rise on milk very quickly, and in order to have the milk evenly mixed when the sample is taken it is necessary to dip out a small portion of the milk immediately after it has been poured from one vessel to another. Samples have been sometimes sent us to test and the absurd results obtained show that they were not fairly taken.

This inaccuracy of sampling is often caused by ignorance on the part of the parties taking the sample. Not every one realizes how quickly cream will rise on milk. A good many people who own cows are also unaware of the fact that the first milk which a cow gives is considerably thinner than the last milk, or strippings, and samples of milk have been sent to me to test by simply milking into a small bottle which when filled was supposed to represent a fair sample of the milk the cow gave. A great many tests of different portions of a cow's milk have been made and these always show that the first milk drawn tests less than half as much as the last milk. It is not even safe to assume that filling a bottle near the middle of a milking will fairly represent the average composition of the milk given by a cow at any one time.

The sampling of one cow's milk may be done in a satisfactory way by pouring all the milk she gives at one milking into a pail, then after this has been poured back and forth from one pail to another several times, dip about six ounces of it into a bottle at once before the cream has had time to rise to the surface. Fill the bottle to the cork in order to prevent churning by the agitation during transportation. Carefully pack in a small box and send by prepaid express to the Dairy School, Madison, Wis. We are willing to test such samples for Wisconsin dairymen at any time, and we do a great deal of this work every year.

The sample of one milking, however, will not necessarily give a correct idea of the average composition of the milk a cow gives, because the richness of any cow's milk will vary from one milking to another. It is not always the same from day to day, but the test may go up and down from various causes. Anything that excites the nervous system of a cow will have an effect on the test of her milk. Indigestion has also an immediate influence on milk secretion. If the cows are roughly treated by driving them from pasture, or by standing in cold, wet rain or wind, the milk secretion is influenced to such an extent that changes in the test may be noticed and become as radical as changes in the weather.

Every farmer who owns cows would be greatly benefitted by owning a small Babcock tester and using it in his own herd. He will then find that the test of some cows' milk will vary in a very un explainable way from day to day, and that the milk of other cows will be uniform in test.

The mixture of several cows' milk, or the milk that is taken to a factory from a farm each day, will not usually be influenced by the same conditions that cause a variation in the test of one cow's milk. If this mixture of milk from a herd is to be tested, the sample ought to be taken immediately after the entire lot of milk is poured from one can to another several times until the cream is thoroughly mixed through it all. A small quantity of this milk well mixed will fairly represent the whole, and if this is the kind of milk you wish to sample, you may fill a bottle of it to the cork and send it to us as I have already suggested, the sample of milk from one cow may be sent.

DIFFERENCE BETWEEN BUTTER AND BUTTER FAT PRICES.

I am in need of some advice and come to you for information as to what I shall do in order to compete with a creamery that pays more for a pound of butter fat than butter is worth. The butter at my creamery is selling as extras and the overrun is about 12 per cent. We handle all milk, no cream at all. A neighboring creamery has between forty and fifty cream patrons, but no milk patrons. The farmers here do not understand why it is that the price per pound of butter fat paid at the neighboring creamery is higher than the market price of butter.

What kind of a sampling tube would you advise using for taking samples of milk at the milk weighing can? R. B.
Arkansaw, Wis.

The difference between the price paid for butter and for butter fat at a creamery is a point which is not well understood by all creamery patrons. Most of them are aware that the Babcock test shows the butter fat in milk and that this is from ten to fifteen per cent less than the butter which will be made from the milk; but few have had occasion to look into the matter any further than this. You will find that it will be profitable for you to make the problem clear to your patrons so that they will understand why there is a difference in the price of butter and of butter fat. You can do this by means of a calculation something like the following:

Suppose your factory received 150,000 pounds of milk in one month and the average test of this milk was 4.0 per cent fat; then the pounds of fat delivered to the factory will be 6000,—150,000 x .04= 6,000. If your overrun is 15 per cent there will be 6,900 pounds of butter made, —6,000 x 1.15=6,900. Now we will suppose that the butter sold for 20 cents per pound, then this will bring $1380.00. If the expenses of operating your factory during this time are $120.00 there is left $1260.00 to pay the farmers for the 150,000 pounds of milk or the butter fat it contained. The next thing neccssary to do in order to find out how much each patron should receive for his milk is to determine the price that will be paid for one pound of fat or for one pound of butter according to the arrangement made at your factory with the patrons. In this case the price paid per pound of fat will be found by dividing the $1260.00 by the 6000 lbs. fat which gives 21 cents. If you wish to pay by the price per pound of butter then the $1260.00 must be divided by the total weight of butter, 6900 pounds, and this gives 18.2 cents as the price to be paid for butter.

In either case you will see that the patron will obtain the same amount for his milk no matter whether he is paid by the price per pound of fat, which is 21 cents, or the price per pound of butter, which is 18.2 cents. The difference in price simply comes from the fact that in one case we have estimated that there is 15 per cent more butter than butter fat in the milk delivered by each patron, and this will naturally diminish the price per pound of butter below the price per pound of butter fat, or in other words, more butter is made from 100 pounds of milk, but it is paid for at a smaller price per pound than the butter fat is paid for.

If you can get your patrons to understand this matter, I think they will not be inclined to get dissatisfied because some other creamery is paying a higher price per pound of fat than you are paying per pound of butter. The net sum received per hundred pounds of milk of the same test may be very nearly the same at the two factories, and when the patrons understand this they will not be disturbed by differences of three or four cents per pound in the prices they receive.

This is probably an explanation of why the creamery you mention is paying more per pound of butter fat than the market price for butter. It pays for a less number of pounds of butter fat than of butter and consequently can pay a larger price per pound.

The taking of samples of milk at a creamery may be fairly well done by means of a small dipper which will hold between one and two ounces of milk. Dip this full of milk from the weigh can before the cream has time to rise and immediately after weighing the milk. This method is usually sufficiently accurate for all practical purposes. A "milk thief" or a long, cylindrical tube for tak-

GLOSSARY.

The terms used in the above table and in the discussion of feeding problems in HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DRY MATTER.—That portion of a feeding stuff which remains after all the water or moisture has been expelled by heat.

DIGESTIBLE NUTRIENTS.—That portion of the dry matter which can be digested by the animal and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES.—That part of the digestible nutrients which is the primary source of sustaining animal heat and furnishing the energy for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses, are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen-free extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude* fat. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

FEEDING STANDARDS.

Various experiments have been conducted with a view to ascertain the amount of feed and the varying amounts or proportions of the several digestible nutrients required by domestic animals under the differing conditions in which they are placed. It is evident that a horse or an ox, at rest in a stall, requires less feed than when at work, and that a dry cow should not be fed in the same way that one would feed her when giving milk. The more work required of the horse, and the more milk yielded by a cow, the greater is the demand for food. In the nature of the case there can be no exact and arbitrary standards laid down. What will suffice for one animal may be either too much or too little for another accomplishing the same work, owing to differences in adaptability, in digestive and assimilative powers, and in care and environment. It is well known that the well groomed and properly stabled horse requires less feed for the same work than the same horse left to shift for himself without grooming or shelter. It is equally true that the milch cow responds by larger results to good care and proper shelter.

It does not follow that the labors of investigators in seeking to establish standards for feeding, have been fruitless. On the contrary, the results already attained are most helpful if rightly used and varied from as circumstances may require. The following table is compiled from the conclusions reached by different experimenters, supplemented by personal experience and reports from readers of HOARD'S DAIRYMAN:

ANIMAL.	Daily allowance for 1000 lbs. live weight. Dry Matter.	Digestible Nutrients. Protein.	Carbohydrates.	Ether Extract. (Crude Fat.)
COWS.	Lbs.	Lbs.	Lbs.	Lbs.
At rest in stall	15 to 20	0.5 to 1.0	7.0 to 10.0	0.1 to 0.3
Giving milk	20 to 30	1.6 to 3.0	10.0 to 16.0	0.5 to 1.0
HORSES.				
Light work	15 to 20	1.5 to 2.0	9.0 to 10.0	0.4 to 0.6
Heavy work	26 to 30	2.5 to 3.0	13.0 to 15.0	0.8 to 1.0
YOUNG DAIRY STOCK. Age in months. / Av. live wt. per head, lbs.				
2–3 / 150	23	4.0	13.0	2.0
3–6 / 300	24	3.0	12.8	1.0
6–12 / 500	27	2.0	12.5	0.5
12–24 / 700	26	1.5 to 1.8	12.0 to 12.5	0.3 to 0.4

The food of support, or the simple maintenance ration, is the amount required to hold the animal at a uniform weight when no energy is expended in exercise or milk giving. The larger the animal, other conditions being equal, the greater the amount of feed required for this purpose; but the variation in this respect does not run parallel with the variation in weight. Thus a cow weighing 800 pounds will require more feed per hundred than one weighing 1000 pounds or 1500 pounds. Instead of deducting, for such an animal, one-fifth from the maintenance ration, as given above, it would be nearer right to deduct not more than one-sixth. Whatever is consumed beyond the requirements for maintenance, supplies the material for growth, for making milk or furnishing the power expended in work and exercise and combating enemies and the elements. It follows that as conditions vary the standards should vary.

It should not be forgotten in compounding a ration that the stomachs of different classes of animals vary in relative size. The cow has very capacious receptacles for food, showing that she is fitted to consume relatively more coarse fodder than other animals, and hence, in arranging her feed, regard should be had both to bulk and the proper distribution of the nutrients throughout the entire mass. For example, 20 lbs. of timothy hay or 10 lbs. of corn will furnish practically equivalent amounts of nutriment, but the cow will not thrive on corn alone, because of the defective digestion, consequent upon failure properly to distend her stomachs and subdivide the concentrated food. Those of us who belong to the generation that went "through the war" remember that "roughage" was quite as essential as grain for the continued well being and endurance of the animals. The prescribed army ration for the horse contains practically an equal amount of roughage and grain; for the cow, under ordinary conditions, we think it best to have about two-thirds of the dry matter in roughage and one-third in grain. When feeding heavily for rapid increase of weight or extra flow of milk, this proportion cannot be maintained, but the roughage should not be materially decreased.

HOARD'S DAIRYMAN aims especially at giving the milk producer—the farmer who keeps cows—the very best and clearest scientific and practical information that can be obtained on the feeding question. It is always ready to answer any and all questions that it is able to on the many sides of dairy practice. For the trifling sum it costs, only $1.00 a year, less than 2 cents a week, it would seem no man who really values sound knowledge and who seeks the best profit can afford to be without it.

Suggestions for a Missouri Barn.

ED. HOARD'S DAIRYMAN:—I am expecting to build a barn this fall to accommodate 4 horses, 10 cows and 25 to 30 sheep and goats. The location which would be most convenient is on a side-hill, and with an abundance of good flat limestone on the place, I could make it with a basement very cheap, and as I expect to raise tame hay, it would seem to a layman this plan would be best, for it would give plenty of hay-loft room.

May I presume to ask such suggestions upon this subject, as your time will permit, as to size, ventilation and general arrangements?

I have plenty of loose rock to concrete the bottom, and with water from my windmill could have a good arrangement for watering stock. G. L. C.

Missouri.

There is no objection to a basement stable, provided it is properly constructed, and has an abundance of light. The best way to build a basement is to excavate in the bank at least six feet in width on sides and ends from where barn is to stand, and build a retaining wall. Then on very low foundation walls build the basement of six or eight inch studding, so that it shall be eight feet from the floor of the stable to the bottom of the joists which are to carry the upper floor. On this framework erect the barn proper, just as though it was to rest on a stone wall.

The reasons for recommending the retaining wall and area are, first, that a bare stone wall is both cold and damp; and, second, in no other way can one secure proper light and ventilation, unless, indeed, there is not more than five feet of excavation, It is admitted that but few barns or stables are built in this way, but it would be a decided improvement to many if they had been so built.

There should be from 10 to 12 good sized windows in this basement, hinged at the bottom to open inwards from the top. This will prevent storms beating in when windows are open. There should be also not less than 8 inlets for fresh air, well distributed, openings equivalent to 12 by 12 inches and constructed as shown in Fig. 3, opening inwardly at the ceiling and outwardly 3 to 6 feet lower. If basement is constructed as we have suggested the spaces between studding may be used for these flues, but if stone walls form the basement, then flues like chimneys should be provided as the walls go up

The outlet for foul and cold air, 3 ft. × 3 ft., may be located, as shown, in one corner of the box stall, or, if it is not practicable to have a door in that end of the barn, locate this flue in the center. If placed to one side of the center make a long bend in the upper story to give exit at the ridge.

As will be seen from the cuts herewith we have provided for an extra horse and cow and added a box stall, but have omitted all provision for sheep. This can better be supplied by building a low shed at some convenient place, either attached to or separate from the barn proper. About all that sheep want, especially in the latitude of Missouri, is shelter from storms. A stable warm enough for cows and horses would be too warm for sheep. Make a closed shed, with two or three openings for convenience of getting in and out, and not be over particular about battening the cracks.

The horse stable may be shut off from the cow department by a couple of sliding doors, and the space not needed for horses will be convenient for feed bins, calf pens, or storage for wagons and tools.

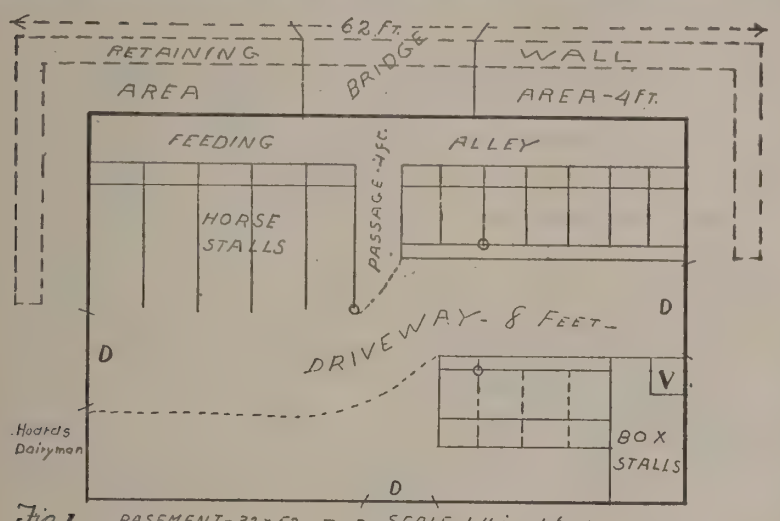

Fig. 1. BASEMENT-32×50 — SCALE-1-16 in.-1 foot

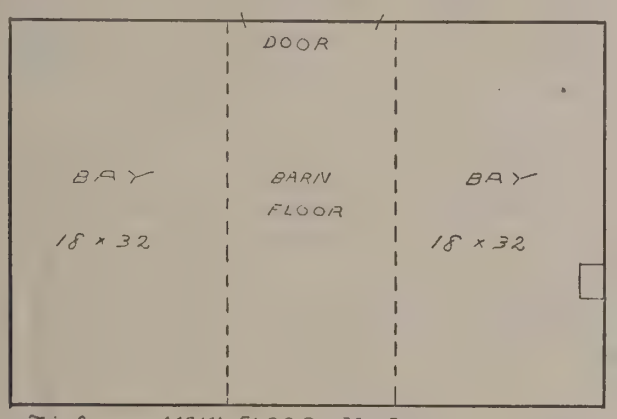

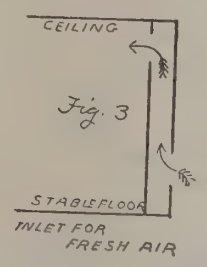

Fig. 2. MAIN FLOOR-32×50

The three circles at rear of stalls indicate location of posts for supporting girders to carry joists.

Clover Taint in Milk and its Product.

I have trouble with my milk when I turn my cows in fresh clover—red clover pasture. The milk, cream and butter take a peculiar flavor, somewhat disagreeable. What can I do to prevent it? I am making a good grade of butter at fancy prices, and this annoys me a great deal.

Cecil, Wis. N. N.

Let the cows have less of the fresh clover and more of some other forage. Especially, take the cows out of the clover some hours before milking. The clover flavor usually disappears of its own accord after a few days, partly because the cows do not eat so ravenously or so much, and partly doubtless because the clover becomes more mature.

DON'T PUT OFF

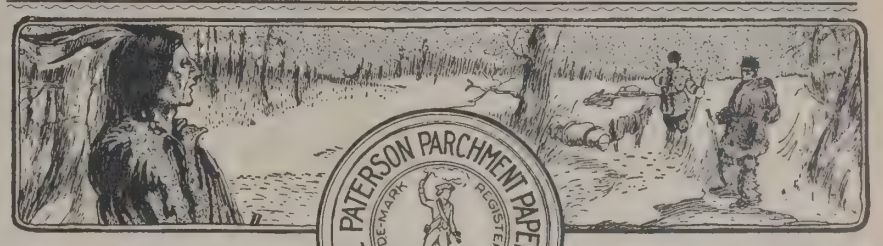
Seeing your friends and having them join in for a good club of subscribers.

In the past three years the actual weekly sales of the

EMPIRE CREAM SEPARATOR

have increased more than 1000 per cent.

In other words, we are selling more than **ten times as many** separators as we sold three years ago.



And the demand still increases.

Not strange. Every EMPIRE sold in a neighborhood sells a dozen more. It's the kind of separator folks like.

Our book tells why.

Don't buy a separator on anybody's "say so." Investigate for yourself.

EMPIRE CREAM SEPARATOR CO.,
Bloomfield, N. J. **Chicago, Illinois.**

The Flavor of Good Butter

is easily destroyed by contact with foreign substances. The problem is how best to protect it for table use. Up-to-date butter makers with one accord now resort to the

Pioneer Brand Parchment Paper

for wrapping pound prints and lining boxes and tubs. **Pioneer** is not a so-called parchment. It is a pure vegetable product, without taste or smell, and seals the package from foreign smells and holds the fine flavors. Name or trade mark printed on each wrapping sheet if desired. Ask for samples and book, "Better Butter." Sent free for the asking.

The Paterson Parchment Paper Company,
37 Eighth Street, **Passaic, New Jersey.**

Truth to Tell

There are no other milk cans made that can equal in wearing qualities the genuine

BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned, **Remember,** the Buhl is the only can in the world that is made with the **Buhl "Victor" Can Breast** and the **Buhl "Victor" Round Handle.** As there are many inferior imitations of this can, we stamp all ours with the **Milk Can Trade Mark.** Look for it. Sold by all live dealers. Ask about them, or write us direct.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

COMING EVENTS.

Indiana State Dairymen's Meeting, Plymouth, Dec. 10-11, 1903.
Missouri Dairymen's Meeting, Columbia, Dec. 8-10, 1903.
Minnesota Dairymen's Association, St. James, Oct. 21-22, 1903.
New York Dairymen's Association, Ogdensburg, Dec. 8-11, 1903.
Vermont Dairymen's Association, St. Albans, Jan. 5-7, 1904.
Illinois Dairymen's Association, Greenville, Jan. 5-7, 1904.
Wisconsin Cheese Makers' Association, Milwaukee, Jan. 6-8, 1904.
Ohio Dairymen's Association, Columbus, Jan. 27-29, 1904.
Wisconsin Butter Makers' Association, Feb. 2-4, 1904.

A WISE LAWYER.

The statutes of Wisconsin relating to adulterated or unclean milk provide that exception shall be made in prosecution concerning milk that has been pasteurized. Dr. Mitchell, the former state chemist, tells a good story in this connection.

A farmer was prosecuted for adulterating his milk. The lawyer employed in his defense said to the court: "Your honor, this complaint is defective. It does not conform to the statute which makes exception of all milk which has been pasteurized, and Sir, we can prove that the cows of this defendant have been on pasture for two months."

The lawyer smiled a ghastly smile when he was shown his ignorance of the term "pasteurization."

FEED LIMITATIONS.

When a surveyor starts to run out the route for a new railroad the first thing he studies is, "the lay of the land." He knows that in a large degree he must conform to the configuration of the country. There are some things he cannot do and some that he can do. His science has its limitations. So it is with this science of dairy feeding. The primary object in the feeding of cows is the production of milk, not butter or cheese, even if these elements are what we are principally after. We will get the right idea of this matter if we always keep in mind the following principles:

(1) Milk is composed of several elements, chief of which are milk sugar, casein and butter fat.

(2) These elements are always in a certain proportion, to each other.

(3) That proportion is governed in the main by the individuality of the cow herself and not by her feed. At her birth she was given her proportion—such a percentage of casein, milk sugar and fat, and that proportion continues with slight variations, till her death.

(4) That if we wish to produce milk with an excess of butter fat, over the average, we must make it a birth question—breed for it.

(5) The cow cannot change the relative proportions of her milk to suit our convenience. All we can do with feed is to assist her to produce a larger quantity of milk of her own individual proportion.

A clear understanding of the working of these principles enables us to see what we can do and cannot do with feed.

Right here commences the scientific study—and by scientific we mean *practical*—of feeds and methods of feeding. The principle of balancing the elements of food so that the cow may be best assisted to make milk and in profitable quantity, starts here. Also the study of environment, how to promote her health and comfort, how she shall be personally treated, for all these things have an important bearing on the return in milk she will make from our feed. Right here is shown the importance of dairy intelligence over dairy ignorance. Thousands of men are ignorant of these things, or have but a very faint idea of how they operate, and they suffer very greatly in the profit of the business, by such ignorance.

Right at this point starts the consideration of the work of breeding. As we said under the 4th head, if we wish to increase the proportion of butter fat, secure richer milk, we must breed for it, for we cannot feed for it. All that we can do with feed is to increase the quantity of the milk such as it is. What the milk is the cow determines. As she is born so will she continue. If we wish her to give milk of a different proportion in its constituent elements, we must see to it that she is born in the right direction. This is the province of breeding, and it has its own limitations to study and obey.

A WORD WITH MR. CLAWSON.

The Senior editor of HOARD'S DAIRYMAN desires in this way to express his great appreciation of the valuable article written by Mr. P. Clawson of Butler Co., Ohio, found on page 722 in the issue of Sept. 18.

In this article Mr. Clawson contributes generously of his valuable experience in the growing and ensiloing of alfalfa, thus furnishing valuable data for the guidance of others on this important matter. He speaks of the great difficulty of curing it for hay. He is correct, if it is to be handled as ordinary hay is handled. But in our own experience we have been able to overcome this difficulty very considerably by the use of the cotton cloth hay caps. If alfalfa is cut and cured in the windrow and then hauled to the barn or stack, three serious difficulties are likely to occur:

(1) The hay becomes too dry if the weather is fair and sun is hot, and there results a serious loss of leaves.

(2) The first heating and sweating must take place in the mow, and this is sometimes dangerous.

(3) Alfalfa is much more valuable as a hay, if cured in the shade, by being cocked up as soon as wilted sufficient to handle well on the rake, and then covered with the hay cap.

If the weather is catchy the hay cap is doubly valuable. Our method is to cut the alfalfa as soon as the first blossoms appear. Early cutting with each crop, insures a much stronger growth to follow. Then the hay is cocked up as above described, and remains in the cock with an occasional brief opening, until it has gone through the first sweat. Care is taken to move the cocks onto fresh ground every two or three days to prevent smothering the plants under them. The present summer has been the hardest one in which to make hay, on account of wet weather, we have ever known, yet, by the use of the hay caps and methods as described, we have put in three heavy cuttings of alfalfa in good condition most of it, from 32 acres.

The cost of these cotton cloth hay caps all stringed and weighted, is only about 12 cents apiece, which is a trifling expense when we consider the valuable aid they bring in by saving the hay in good condition.

We are curious to know how Mr. Clawson gets his alfalfa ensilage out of the silo with any ease whatever, if he puts it in whole. Like clover it makes a tangled mass that holds together tenaciously, and it would seem as if when packed hard in the silo it would be a matter of much difficulty to get it loose. Will Mr. Clawson please tell us if he does not find this to be the case. If so how does he overcome the difficulty?

A MODEL MISSOURI FARM.

The spirit of dairy progress, of dairy understanding, of dairy beauty, as well as profit, is abroad in the land. It is found in the sunny South, on the Pacific coast, in rugged New England, in snowy Canada, in the great middle west: Every where that the gentle cow doth go there is the spirit that "seeketh for perfection in knowledge and deed." All this striving for better thought, better understanding, better work is a splendid feature of our civilization.

In St. Louis is published a rather unique magazine, called "Tact." In the issue of July 15th is contained a description of "how the pure milk problem has been solved for St. Louis through scientific methods by Mr. Sylvester P. Keyes," written by John G. Small. The establishment is situated at Keyes Summit, seventeen miles southwest of St. Louis. We have time to mention but a few of the features of this worthy effort to produce milk in all its purity. Mr. Keyes has expended $60,000 in this enterprise, and we are glad to know that it has met with encouraging response from the people of St. Louis.

The plant is under the superintendency of Mr. J. L. La Rowe, who is a well schooled and experienced dairyman, assisted by Mr. Archie A. Keyes, Secretary of the company, who is a graduate of the Columbia Agricultural School and a student of scientific dairying.

At present 200 cows are handled and cared for in a manner to produce the cleanest and best milk possible. The milking commences at 1:30 in the morning with 20 milkers.

First the milk is taken to the cooling room where it is twice strained and filtered and cooled, by being run through the aerator and reduced in temperature to 30 degrees. A portion of the milk is creamed, and the balance is taken to the city branch office where it is placed in bottles, packed in chipped ice and distributed to customers. When the bottles are returned they are scientifically cleaned. This means that they scrubbed with hot water, alkaline mixture and brushes, then sterilized and rinsed in filtered water. All the water used is from artesian sources. Physicians recommend this milk and cream, because it is scientifically clean.

A complete system of waterworks permeate the system. The stalls are thoroughly cleaned by washing every dav, and as much care is taken to secure ventilation and disinfection of the cow quarters as is taken to keep the milk clean.

It has been very difficult to get it into the minds and comprehension of dairymen that a cow needs as pure air as they do. Indeed, it is questionable whether they have had very clear ideas about the ventilation of their own homes and especially their sleeping rooms.

We need all over this land just such object lessons in clean, honest dairying as is presented in the Model Missouri Dairy Farm.

SHY BREEDERS.

One of the difficulties which dairymen have to contend with is the habit some very valuable cows take on of being shy breeders. They become barren and soon have to be turned over to the tender mercies of the butcher.

Wherever abortion has prevailed in a herd it is quite apt to end in barrenness, and often so with cows who have never aborted. Another potent cause of barren cows is the feeding of too much corn and other carbonaceous food. There is an intimate connection between the process of gestation and the character of the food the mother eats. Hence it has become a common saying ofttimes, concerning a barren cow, "She is too fat." On general principles fat is opposed to fertility. Then, again, gestation is a process which has to do very particularly with the nervous system, and food containing sufficient protein, which is a nerve supporting element, is necessary to put the mother in proper condition for the work of gestation. This is one of the important reasons why alfalfa is so useful a food for all breeding animals, as was witnessed by our experience with brood sows, reported recently in this paper.

Sometimes the fault of non-breeding is the fault of the male. Dairymen are quite apt to shut up their bulls and not give them sufficient exercise. This injures their breeding power. Even if such bulls cause conception, there is a lack of vigor in the offspring. It is comparatively an inexpensive thing to provide a good single tread power and train the bull when young to work this power. He may be made to run the farm separator and will at the same time take on increased vigor and sureness as a sire. It will also help greatly to humanize him, make him decent and tractable. There is nothing like plenty of work to keep men and animals out of mischief.

Every dairy farmer should be a reader and student of the breeding question. It contains laws and principles, a knowledge of which will help him greatly in the production of desirable farm stock and ofttimes save him from serious losses.

TEMPERATURE IN SHALLOW PAN CREAMING OF MILK.

But few comparatively of the people who make butter in the United States, have centrifugal separators. Their method of separating the cream is either by shallow pan, or deep setting. To such it may prove interesting to read the following statement of the difference in these methods, in furthering as complete separation of the butter fat as possible. The experiment is recorded in Prof. Dean's new book on "Canadian Dairying."

"The average of three years experiments at the Ontario Agricultural College, in which about 4,000 pounds of milk testing on average of 3.66 per cent fat, were creamed by each method, the shallow pan skim-milk contained an average of .31 per cent fat; the skimmilk from deep-setting methods contained an average of .29 per cent fat; the separator skimmilk contained an average of .09 per cent fat.

Further experiments were made to show the effect of temperature on the thoroughness of separation in the two methods of shallow pan and deep setting. Cans of milk cooled to an average temperature of 41 degrees contained two-tenths of one per cent fat, that is two-tenths of a pound in 100 lbs. of milk.

Similar cans cooled to 47 degrees gave a loss of three tenths per cent fat in the skimmilk, while lots of the same milk cooled

to 57 degrees contained 0.7 per cent fat, or over three quarters of a pound of butter in one-hundred pounds of milk."

If some of those people who think skimmilk is not worth much as a feed would find out how much fat they waste in it, perhaps they would have a higher idea of its value, commercially at least.

CITY MILK TRADE.

The city milk trade is a department of dairying peculiar in many respects. The handling of immense quantities of milk in a rapid and cleanly manner calls for conditions not found in common dairy practice. As a rule there is but little system in the methods used in handling this milk. As a city increases in size and more milk is called for, more men enter into the business, and larger quantities of milk are handled, but in no case is any one city able to guarantee the purity and healthfulness of its milk supply. There is a little good milk that brings extra prices, some milk of fair quality, and an immense amount of poor milk.

This city milk has always been a source of trouble to doctors and boards of health, and much has been written and many investigations made regarding its quality, but the actual improvement has not been great, owing to the conditions under which it is handled, and the element of politics, which always enters into any attempt at regulation, thus neutralizing to a large extent all efforts of law makers and boards of health.

Of late years there has been a general public sentiment towards a better quality of milk, and it has become so strong that even politics cannot entirely neutralize it and better city milk seems to be a coming possibility.

One of the best monographs on this subject that we have seen is Bulletin No. 46 of the United States Bureau of Animal Industry, entitled "The Milk Supply of Two Hundred Cities and Towns." This bulletin is in two parts, the first being a compilation of the laws and ordinances existing in the various cities and towns of the country, and the second contains suggestions for the improvement of the milk supply, and conditions influencing the product.

Just now, there seems to be no medium between the high-priced milk (certified milk) from a model dairy, and the general run of low priced market milk, nor a true appreciation of the fact that a good quality of milk can be produced without fine buildings, high-priced cattle and expensive methods. As the bulletin says:

"A truly 'model dairy' is one which is conducted in the best practicable manner known to science. They are not necessarily places where money has been lavishly expended for fine blooded cattle and highly adorned buildings;such places, if they are not properly conducted, are far from 'model.' But they are dairies where milk is produced and handled that is as clean and wholesome as milk can be made; the cows are in good condition, free from disease in any stage, and frequently examined by a skilled veterinarian, who removes from the herd any suspicious animals; none but wholesome feeds are used; the stable is abundantly lighted and well ventilated, often thoroughly cleaned and kept in a correct sanitary condition; the cows are kept clean and comfortable; the attendants are healthy and cleanly; all utensils are sterilized daily; great care is taken to protect the milk from contamination; the milk is promptly cooled, and it should contain less than one one-thousandth part as many bacteria as are found in much of the milk regularly sold in cities and towns."

Cleanly methods are within the reach of every milk producer and the introduction of such methods, does not necessarily call for lavish expenditure, and when the producer can be induced to practice cleanliness—common every day cleanliness, not the expensive variety—and the dealer handle the milk as a quickly perishable article should be handled, there will be an approach to a practical cleanliness that will do much sometime towards bringing about the ideal, but the last is a long distance in the future.

One of the difficulties that stand in the way of reform, is the formation of rules for milk production, by men who are largely theorists and certainly know little about the actual milk work. An excellent sample of this kind of work is found in the contract required by the Medical Milk Commission of Essex Co., N. Y., which the dairyman must sign and fulfill before supplying milk that can be endorsed by the commission. The contract consists of 68 rules and regulations, most of which are excellent, but there are some that indicate that the compiler is stronger on theory than practice. Thus under rule 22, it is agreed that the dairymen shall exclude from the herd, "any animal that was bred through consanguinity within three generations." This is evidently the result of the good old medical superstition that inbreeding with the bovine race, will always produce disease. An examination of Jersey records would prove the contrary, but the above is too well grounded in medical lore to be overthrown by facts to the contrary. The result of the rule will be to throw out a large number of valuable dairy animals, if the rule can be enforced, which is doubtful.

Under the head of feeding, is the following: "The feed and fodder shall consist only of nutritious and wholesome materials, such as grass, clover and timothy hay, whole grain, or the entire result of the *grist*." There shall not be fed * * * * * * * hulls, screenings, wet or dry brewers grains, oil meal, sour ensilage * * glucose of starch factories, any waste by-product in the treatment of grain, etc.

The above excludes corn bran, wheat bran, middlings, corn meal, malt sprouts, buckwheat middlings and all of the gluten meals and feeds and a complete non use of ensilage, since all ensilage contains acid. This is a fool theory carried to extremes, and shows that the compiler of the rules needs some practical dairy knowledge on feeds and feeding.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Customary Price of Cream.

Please advise me through HOARD'S DAIRYMAN the customary price per quart for cream delivered at private residences, that tests 20 or 21 per cent, butter fat. SUBSCRIBER.
Delaware, Ohio.

Prices vary so much in different localities, that it is impracticable to say what the customary price of cream is. At the Wisconsin Dairymen's Convention in 1902, it was stated that cream should net the farmer about 2½ cents per gallon for each per cent of butter fat it contains. One dairyman reported he was receiving, net at his railroad station, 60 cents per gallon for 25 per cent cream; and another that he was receiving 25 cents per quart for 32 per cent cream delivered to city customers. The retail price of milk should largely govern the price of cream.

A New Jersey Ration.

Will you kindly help me formulate ration for our cows, grade Jerseys, to freshen this month and next. Mixed timothy and red top hay on hand, wet beer grains $5.50 per ton; linseed meal, O. P., $32.00 per ton; cotton seed meal, $31.00 per ton; gluten feed,$28.00 per ton; corn meal, $26.50 per ton; bran in 200 lb. sacks, 23.00; per ton corn and cob meal, $22.00 per ton.

Can you give an analysis of foul meadow hay?
Bernardsville, N. J. G. W. T.

From the feeds named we should be inclined to select the wet grains and gluten feed, and as a maximum would allow about 20 lbs. of the former and 3 lbs. of the latter. Assuming that a cow would eat 20 lbs. of hay, the allowance for one day would tabulate as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. mixed hay	17.80	.76	9.03	.24
20 " wet grains	4.86	.78	1.86	.28
3 " gluten feed	2.70	.70	1.52	.08
Totals	25.36	2.24	12.41	.60

A cow receiving such an allowance ought to yield at least 25 lbs. of 5 per cent milk, or 30 lbs. 4 per cent milk, or 36 lbs. 3.5 per cent milk.

We are unable to find any satisfactory analysis of foul meadow hay.

A Minnesota Ration.

Would you kindly formulate a ration for milch cows, of the following named feeds: Corn ensilage, cut when corn was good roasting ears; bran, $14 per ton; shorts, $16 dried malt sprouts, $6 per ton; plenty of good corn stover; oil meal about $22. C. A. R.
Red Wing, Minn.

We are always a little suspicious of shorts, as too frequently the feed sold under this name is but little else than reground bran. If the so-called shorts are largely composed of middlings, as they really should be, we would substitute 4 lbs. for half of the bran specified below:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
15 lbs. stover	8.93	.14	2.59	.10
8 lbs. bran	7.05	1.00	3.09	.24
2 lbs. oil meal	1.82	.59	.65	.14
Totals	25.72	2.12	10.53	.69

Two Pennsylvania Ration Formulas.

Can you give me a ration for good sized cows. Have a farm, plenty of good mixed hay (clover and timothy,) corn stover and cob meal.

Gluten feed is $26; bran, $20; middlings, $25; rye distillers grain $18; cotton seed meal, $29. Also would like ration for "home" farm; plenty of good silage, German millet, corn stover and some clover hay; feed stuffs same as above; retailing milk here at 7 cts' a quart. J. B.
West Chester, Pa.

There is apparently not much to choose between the gluten feed and the rye grains at the prices named, if both are equally palatable. Sometimes these distillers grains, from lack of proper treatment, do not prove to be relished by cows, but when dried at the right time and with good judgment, they are entirely unobjectionable. The manufacturers of gluten feed seem to have brought this part of their business to such perfection that we have heard no complaint against this product for some years.

In answer to the first inquiry we suggest the following.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
15 lbs. mixed hay	12.80	.72	5.94	.24
8 lbs. corn stover	4.76	.14	2.59	.06
4 lbs. gluten feed	3.60	.93	2.03	.11
4 lbs. corn and cob meal	3.56	.26	2.52	.14
Totals	24.72	2.05	13.08	.55

For cows giving a large flow of milk it would not be amiss to add to the above, a pound of cotton seed meal and, as suggested, 6 pounds of the rye grains may be substituted for the 4 lbs. of gluten feeds.

For the "home" farm herd, we recommend trying about the same amount and proportions of grain, with say, 40 lbs. silage and all the other roughage each cow will eat without waste.

Price of Ensilage.

I want to know what the price of ensilage per ton is when ready to feed. I live six miles from a good market. C. F.
Calcutta, O.

Silage, like all other feeds, can have no fixed market or feeding value. When hay is very high in price, silage would be worth more than when hay is cheaper. Good silage contains a trifle more than one-third as much nutriment as timothy hay, as it is more easily digested, and and has the added advantage of succulence. For these reasons we think it quite within the limits of safety to say that 2½ tons of silage is the equal of one ton of hay for general feeding purposes.

Quality of Meat from Young Calves.

1. What are the cardinal points in establishing the age of a calf up to two weeks old and usually termed "Bob or Slunk?"

2. What impairs the nutrition of veal of a calf under age?

3. What are the distinguishing points on a carcass, which died a natural death and is immediately brought to market and offered for sale? Is such meat fit for food?

4. What book can you recommend for the study of meat and food inspection and where can I procure same? A. B. R.
Chicago, Ill.

We know of no points by which the age of a calf under two weeks old can be established except that in a general way the flesh lacks texture, is soft and flabby. Such flesh is by common consent considered to be improper for human food, but we know of no experiments that have been made to establish the fact. So far as we know the decision is from a theoretical rather than a practical standpoint.

The flesh of a calf that has died a natural death is yellow and the blood vessels contain coagulated blood. As there is no such a thing as "natural death" the animal in all cases, except strangulation or other violent death, having died from some disease, such meat cannot be considered wholesome or fit for human food. Of course there are exceptions, as when an animal has met with an accident that was immediately fatal.

You can probably obtain what you require by writing to the Bureau of Animal Industry, Washington, D. C.

A Herd Record in Book Form.

May I ask for a suggestion for a form of record that would be convenient and so one could find each cow's record for her milk and test,thereby giving her comparative value? Would like a record that I could use in book form. E. W. H.
Lancaster, Mass.

It is not practicable or necessary to enter in a permanent or book record all the daily details of yield of milk and test. Keep these figures on loose sheets and transfer the footings by months, to the ledger account with each cow. Our single cow record sheet was designed for just such cases. It is printed on heavy, manilla paper to withstand rough usage; has spaces for all necessary, daily details for a full month; size 6×15 inches, and sells (postpaid) 25 for 40 cents.

Allowance to Tenant for Growth of Young Stock.

Will you please tell me what would be the right price to allow a tenant next March for the growth on yearlings and calves a year. R. P. K.
Sherburne, N. Y.

It would be impossible, one would suppose, to fix any arbitrary or special price. If the animals have been fed from the undivided hay, grain and pasture of the farm, the increase in value, that is, in their market value, whether more or less, should be divided in the same proportion as other farm products.

On the contrary, if the tenant pays a cash rent, or has fed the stock at his sole expense, he would be entitled to the whole of the increased value.

Painting and Ventilating Silos.

We have built a silo 16×30 feet of white pine, with roof, stone foundation, and cement bottom; have been advised not to paint it outside. We have a preparation to paint it on the inside. What is your advice? Would you put ventilator on roof? J. F.
Dayton, Ohio.

Simply as a matter of good looks, we would advise painting, but it is doubtful whether painting will increase the life of the structure, for the reason that paint will tend to delay the drying out of the lumber, after it has absorbed the silage juices. Railroads have learned that it is not advisable to paint their bridges, for example, until the lumber has become fully seasoned and dry. But with the silo one can perhaps afford to sacrifice something to appearances, and it cannot be denied that a well painted silo is more attractive than an unpainted one.

We cannot say that a ventilator is indispensable to the silo, but there should be some means whereby the heated air and gases may escape.

Effect on the Community of Milk Condensing Factories.

We are about 30 miles from Cleveland, O., connected with the city by electric line. We have cheese factories, but the factory price is not as good as we think it should be all the time. From July 20 to Aug. 20, the price was 70 cents per hundred, deliverd at factory regardless of test.

Would a condensing factory be a benefit to us? This is claimed to be a fine location for one. One or two companies have been here looking the ground over, and we think there will be one put in if the farmers give them any encouragement. What has been the effect on the country where they are located?

The electric road has only been running about 3 years. Only a little summer milk is shipped to the city, but nearly all the winter milk. Winter dairying is only in its beginning here. R. T.
Middlefield, O.

In the "Elgin District" the condensing factories, the creameries and shipping milk to Chicago are about on an equality, so far as returns to the farmer are concerned.

In some ways the condensing establishments, with their strict rules and supervision, are a decided benefit, but on the contrary they have some very absurd notions in regard to feeding.

It would seem that one living within 30 miles of such a city as Cleveland could make it highly profitable to engage in private dairying, finding a special market at good prices for a thoroughly first-class product, either with grocers or private customers; eliminating in this way the charges and subterfuges of middle men and market manipulators.

The Need and Economic Value of Improvement in Dairy Stock.

[By GEO. H. ELLIS, West Newton, Mass.]

After I had accepted an invitation to speak before this body upon "The need and economic value of improvement in dairy stock", it occured to me to consult again the last report of the secretary of this Board, to refresh my memory as to what had been said upon the subject. I found Ex-Governor Hoard's lecture on "Dairy Economics," Dr. Twitchell's "Lesson in Economics," and Professor Colley's "Selection and Improvement of Dairy Herd,"—three admirable papers, covering almost every point which it will be possible for me to touch upon, and better than I can hope to do.

But, as most of these papers treat the matter in the abstract, I decided, at the risk of seeming personal, to use actual figures from our own experience at Wauwinet farm, which have helped us to realize the need and value of such improvement.

Our records show at a glance the number of pounds of milk given by each cow for the past six or seven years, and we are therefore able to make comparisons, not only between our own herd and other herds, but between the different animals in our own herd.

What is the average production of the average herd? Authorities pretty generally agree that in this state it is considerably less than 4,000 pounds per cow; but as this is probably an estimate only, we shall consult figures from carefully prepared statistics in HOARD'S DAIRYMAN, obtained in some of the best dairy sections in New York State.

Mr. W. H. Jenkins, a recognized authority, furnished in the DAIRYMAN for November 14, a table showing the production of 80 herds in Onondaga County, containing 852 head, with an average yearly yield of almost exactly 4,000 pounds; but one-half of these herds were fed largely on alfalfa as roughage, and therein had an advantage over us in New England, where as yet we have not made a success in growing this most valuable of clovers. The 40 herds not fed alfalfa averaged only 3,689 pounds per cow.

In the DAIRYMAN for November 21, Mr. H. H. Lyon, who is conducting an investigation at the Bainbridge creamery, prints statistics from 10 herds, containing 186 cows, with an average of 3,648 pounds per cow; and this furnishes a fairer basis for comparison, as he states the amount of grain fed, which averages only about two pounds per day less than that given to our own cows. Few, however, of these herds are fed ensilage, and therein we have an advantage.

For the purpose of this comparison, we will take the figures of our own herd for the year ending January, 1900, partly because we can make an easier division, and partly because the figures for the two succeeding years show a slight falling off from those of that year. The average of all the 160 cows in milk, or which should have been in milk, for the full year, including all heifers and all aborters, was 6,003 pounds of milk, averaging, in all of the several tests made, a little better than 5 per cent butter fat. There is a difference, then, of 2,355 pounds between the average of the 10 herds reported by Mr. Lyon and the average of our own herd, which at 1¼ cents per lb., would make $29.43 per cow.

But the difference is not less pronounced if we use only figures from our herd; for, of the 160 cows averaging 6,003 pounds, 79, or practically one-half, averaged 7,223 pounds, while the remaining 81 averaged only 4,813 pounds,—a difference of 2,410 pounds at 1¼ cents per pound, making $30.12 as actual cash value of the difference in product,—not of individual cows, but of the best half and the poorest half of our own herd, figured at a fair price at the farm; and yet the average of our poorest half is better by nearly 1000 pounds, than the other averages quoted.

Now, what is the difference in actual value between the animals classified as the "better" and the "poorer half" of our own herd? It is difficult to make an arbitrary figure, because several things enter into the computation which cannot be accurately estimated, among others, the greater liability of the larger producer to milk fever, garget and other troubles, that may take her out of our profitable list. But, assuming the average producing years to be five, the cash value of this difference in product is $150.60. Suppose we pay $50 more for the better than the poorer cow, and allow 5 per cent compound interest on this additional sum,—she would have cost us $66.90 more at the end of five years than the poorer cow, and there would still be $50 difference between a good cow and an extra good cow.

But how are we to obtain these so-called extra good cows? The only satisfactory way I know, is to raise them.

Were dealers or sellers able, as they should be, to state just the amount and quality of milk a cow had given for a full year, or for a series of years, the problem would be a different one. At a meeting of Jersey cattle breeders some years since, a man asked, in my presence, of another who had a national reputation as a breeder of fine cattle: "What do you consider the best points in buying a cow?" "I think the milk pail is a pretty good point," said he. And so it is; but do not be deceived by the cow that gives an immense quantity when fresh. The year's product is the only thing that counts when you balance the year's account.

As to the relative value of cows raised or bought, I have obtained from our books some figures that may prove interesting.

In 1901 we bought in Brighton market, on September 10 and 17, 22 cows, all grade Jerseys, and all bought, I have no hesitation in saying (as I did not buy them myself), with good judgment. They were all fresh and all promising, costing an average of $54.90 each. Our milk scales soon told us that 4 of them were unprofitable, and as soon as seemed desirable we sold them for beef, leaving 18 cows, at an average cost (allowing for the loss on 4 sold) of $61.50. These cows presumably calved in August, 1901, and I find by our records they average to be due again in December, 1902.

We had 34 heifers born between Aug. 1, 1898, and April 30, 1899, which came fresh with first calves in 1901, and it so happened that they averaged to calve in August, and they also average to be due again in December, so we have here a good basis for comparison.

The 18 cows averaged, for the eight months from Jan., to Aug. 1, 1902, 4,048 pounds of milk; the 34 heifers averaged for the same time, 4,431 pounds of milk—nearly 10 per cent more than the cows. And let it be understood these were not selected heifers. Included in this list is every heifer on the farm that came fresh for the first time during the year 1901, whether properly calving or aborting, and 4 or 5 of them did abort. Six of them had their second calves during the time covered by these figures; but eliminating them would not change the result, as all averages would remain the same. The average age of these heifers at calving was 31 months, the youngest to come fresh aborting at 21 months, and the oldest being 38 months. They were all by our own thoroughbred Jersey bulls, and most of them out of grade cows; those out of our thoroughbreds showing little, if any, above the average, either as to quantity or quality of milk.

Many of them were, of course, out of cows of our own raising, they being by our bulls out of grade cows.

Seven of the smallest milkers (mostly aborters) were not brought from Barre to the home farm, and were not therefore tested for butter fat, but the average of the other 27 was 5.05 per cent.

As to the cost of raising these heifers, I am unable to give exact figures. Realizing the necessity for raising our own stock, and appreciating the fact that to do this economically on a large scale it must be done in a good grazing country, we have established farms in Barre in Worcester county, whose hill pastures are hard to equal; but this experiment has not been carried far enough to give results, except in one particular. We lease one farm of about 200 acres, having on it a large barn, the floors of which we utilized with pens holding from 3 to 5 yearlings each, and on the product of this farm we carried last year 85 heifers and 2 bulls, at a cost practically as follows:

Rent of farm	$500.00
Cost of manuring, plowing, planting, cultivating and putting in silo 11 acres of corn	220.00
Commercial fertilizer	42.00
Putting in hay	150.00
Two thirds wages of man 200 days in winter care	150.00
One-fifth cost of silo	50.00
Additional pasture	100.00
Incidentals, say	63.50
Total	$1,275.50

Or $15 each for the 85 head, including cost of carrying 2 bulls. The items for incidentals may be a trifle small, but we had between 12 or 15 tons of hay remaining in the barn in the spring, of

The United States
AGAIN VICTORIOUS
This Time at the Missouri State Fair

which I have no account, and which would more than offset this.

Taking this as cost of carrying for the year, from 1 to 2 years old, what is the cost of carrying for the first year, and for the additional 7 months required to bring them to 31 months, the average age of calving? As to this, I have as yet no definite figures. The first year is, of course, most expensive, involving, as it does, more labor, and cost of milk (fresh and skimmed) and grain, to bring them up to six months old; but it is safe to say that our 34 heifers would cost us at 31 months of age not more than $40 each, against $61.50 for the cows bought.

Among the heifers are probably 5 or 6 which we shall not consider good enough to keep, but this percentage is no greater than with the cows bought; and in the comparison of figures above made I have included, as before stated, the product of every one, including those which are unprofitable, thus materially reducing the average.

Among these 18 cows, the figures of which are here included, are some good ones as well as some poor ones. There are two that gave over 10,000 pounds of milk each in ten days less than a year, between the 10th of September, 1901, and the 1st of September, 1902. The test of one of those giving over 10,000 pounds was 4.45 per cent; the test of the other was 4.62 per cent. They gave a large quantity of milk, but not so rich as our average.

Now, our breeding is not merely to decrease the first cost, but to improve the herd for production; and it goes without saying that whatever the purpose for which we are keeping our cows, thoroughbred bulls should be used, of the breed best suited for the purpose. In our case we took the Jersey for the very plain reason that we are located in a Jersey city. Newton was essentially a Jersey town in the old days, and very many were still kept there when we began this plan of supplying milk in the way we were doing; and in establishing our business, in not a few cases, we bought from proprietors their Jersey cows. Jersey milk was what these people wanted and were willing to pay for, and we have learned to supply what is wanted. If we were making it for contractors, we should not make Jersey milk, but as large a quantity of milk as we could, and maintain the standard, and we should feel that therein we had fulfilled our obligations.

In raising our calves we try to reduce the cost as far as possible, but that is not the main thing. The main thing is to keep them growing, to get strength, to get size and constitution. Our ration for our calves is sweet milk for some days; then we introduce skim milk with linseed meal, and keep before them ground oats and rowen, or good hay. When they are from two to three months old (if it is in summer) they are turned out to pasture; but the skim milk and linseed meal, and for a time some ground oats, are continued. We have raised some very good calves on very little milk, and some included in this record were so raised, using oatmeal gruel in place of skim milk. Where one can have skim milk, I should not advise gruel.

In the leased farm referred to we have not an ideal place; it has an old-fashioned barn, and we have turned all the lower floor into pens. Naturally, it is rather dark.

I hope in the near future to build entirely different barns or sheds in which to winter all our young stock. They will be long, one-story affairs, divided into sections, say about 12 feet square, in each of which I would keep 4 or 5 heifers. The building would run east and west, giving southerly exposure, and each section or pen would have plenty of windows, including one in roof and would open into an outside yard. The doors between pen and yard would never be closed, except in extremely cold and stormy weather. I have used this plan with bulls with great satisfaction, and am confident of its successful use in producing healthy, rugged stock.

If outdoor air is so essential in curing tuberculosis in human beings, as many of our best physicians now claim, it must be equally good in guarding against it, whether in men or animals. Undoubtedly the cost of raising will be somewhat increased, but, as undoubtedly, the results will warrant the expense.

Cheese as an Article of Diet.

ED. HOARD'S DAIRYMAN:—Your article, page 707, reached my table not very long after a report from a young domestic science student. In this report were several bills of fare containing "Fondu" as one article and that, the principal source of albuminoids for the meal. Naturally the cheese article arrested attention. It would seem from the statement that "one may buy cheese sandwiches in Great Britain as readily as those made with meat," as though cheese sandwiches could not be purchased readily in America. If your readers wish to test this, let them make a fair trial in any city, or country town of any size, and they will probably find that cheese sandwiches can be found or made almost any where. Crackers and cheese lunches were common and popular to our grand parents.

The cheese supply is apt to be nearly exhausted in spring, and new cheese is put on the market at a lower price than old cheese commands, in order to realize quickly on it. New cheese, or at least only partially cured cheese, is too frequently put on the market here in America, and the sale is injured from the fact that in this form it is less digestible than after it is properly cured. If only well cured, and therefore easily digestible cheese were exposed for sale it is probable the consumption of cheese would greatly increase.

When cheese finds its way into our tables in a state to "melt in the mouth" with proper mastication, it is easily digestible and cheaper than meat in most localities. This is well understood by a great many Americans who have not studied the subject in Europe, and most all of our cheesemakers know the facts. The error is made in a business way in order to realize early on the product, and we believe the cheesemaker is not the man who is responsible for the too early removal of the cheese from the curing room. We have never met a cheesemaker who would not rather keep the cheese on the shelves until fairly cured, when he knows it will be much better received than when sent out earlier.

In America we know some things that Europeans do not seem to have ever had opportunities to pick up. They are only beginning to learn of the value of American apples and as yet know nothing of the virtues of apple dumplings and apple or mince pies. Over here, however, these articles have been every day affairs and, unconsciously, perhaps, with regard to the scientific balancing of the ration, cheese began to be taken along with the pie.

With the light that is now being shed on diet from the scientific centers it would seem that this is a step in the right direction, toward the balanced ration, even if taken in small quantities. Perchance the eater has at the meal taken meat or eggs enough to supply his quota of nitrogenous food when a larger portion would be wasted or worse. As yet too few people consider these points.

However, the point made, and which we would reinforce is that more cheese could be used with less meat and less expense would be incurred since cheese is so rich in albuminoids. The writer once planned to make a bulletin on this subject and as a beginning proposed to use cheese in his own family and to write from practical experience as well as from other points of consideration.

Shim milk cheese was sought for cooked articles because richer in protein and cheaper but it could not be found readily. Imperfectly cured cheese was cooked. The object aimed at was to show that these articles could be used readily and safely, and that the expense of a really nutritious diet would be much less than with meat.

The great obstacles to be overcome are that our people are addicted to a meat diet and they are not accustomed to cheese. Thefore they like the one and do *not* like the other. This taste for one and distaste for the other at home stopped the bulletin. But the work went far enough to bring an acquaintance with cheese as a staple article of diet which has grown and the report of the bill-of-fare named at the opening of this article came from one of those who objected to cooked cheese at that time. Now it is, perhaps, a commonly selected article as a principal dish for a meal now and then, and is relished by all.

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Cornish, Curtis & Greene Mfg. Co.,

General Sales Agents De Laval Alpha Separators,
FORT ATKINSON, WIS.

If wise old Solomon, twenty-eight hundred and fifty years ago, and twenty-four centuries before Gutenberg made the production and multiplication of books relatively cheap and easy, in the bitterness of his despair was led to exclaim: "Of making many books there is no end," how much more may we, in this twentieth century, lament that there is neither time nor strength to go through the accumulating thousands of publications that have to do with the one division of agriculture to which Hoard's Dairyman is specifically devoted. We do the best we can to keep abreast of the times, both by original research and careful scanning of the books, bulletins, pamphlets and other publications that come from the fecund presses of Europe and America. Much of this reading matter, we regret to say, when not fatally misleading, is practically worthless, and excuses in a degree the contempt so many dairymen have for book farming. But when the winnowing process is completed, when the chaff and foul seeds have been eliminated, there remains not a little that is helpful and stimulating. From time to time we transfer the best of this to our columns, generally much condensed, but seldom anything more unreservedly to be commended to the studious consideration of our readers, and especially to those who have not been as successful with cows as they would like to be, than the article on "The Need and Economic Value of Improvement in Dairy Stock," a paper prepared and read by Mr. Geo. H. Ellis, at the Public Winter Meeting of the Massachusetts Board of Agriculture last December and copied from the Fiftieth Annual Report of that Board.

Mr. Ellis is one of the prominent and successful business men of the city of Boston, whose home is at West Newton, where he owns twenty-five acres of land which is called "Wauwinet Farm." Some 12 or 13 years ago he was selling eighteen quarts of milk daily to his neighbors. The quality of this milk, both for fat content and freedom from dirt and bacteria, was such that there was a constantly increasing demand, and being the shrewd business man that he was, he continued, as he was able, to supply this demand and at the same time produce the milk at the least practicable cost. Additional land, some of it vacant city lots and blocks, and some of it as far away as fifteen miles, was rented, and other land purchased, until at the present time the active dairy herd numbers 160 cows in milk.

Mr. Geo. T. VanNorman, an occasional correspondent of the Dairyman, is the resident superintendent, but, as will be seen by reading the article, Mr. Ellis himself is the general manager and every detail feels the impress of his management. What Mr. Ellis has to say, therefore, is founded on the business man's theory that every dollar invested and every dollar expended must return a satisfactory cash income. He has theories. He has been a student as well as a reader of Hoard's Dairyman, but for the occasion he confined himself to the concrete facts as they had developed among his own cows and on the land where they were cared for and fed.

It needs no apology from us for transferring Mr. Ellis' paper, and the discussion which followed, to our columns, notwithstanding the extra space required to print it in full. We give a part only in this issue and the balance will follow next week, and, unless we greatly misjudge, some tens of thousands of our readers will so far profit from its careful perusal as to adopt the principles, and as far as they can, the methods which have made Wauwinet Farm and its dairy as profitable as they are exceptional.

One Hundred Per Cent Gain in Five Years.

A Vermont Report of Progress.—Suggestions for Ration Requested.

Ed. Hoard's Dairyman:—Please give me balanced ration for my cows; price of feed as follows: Have plenty of good ensilage and mixed hay, also some oat hay; corn meal, $1.25; gluten, $1.60; gluten feed, $1.40; distillers grain (Ajax flakes) guaranteed 34 to 36% protein, 12 to 14% fat, $1 45; mixed feed, $1.20; bran, $1.10 per hundred weight.

My cows will weigh from 800 to 1,000 lbs.; will be all new milch except one and are capable of giving from 20 to 35 lbs. of milk per day.

I greatly appreciate your paper and have learned many things from it.

My dairy is not large, but last year I put in a round silo, finding the main points of its construction in the Dairyman. Am well satisfied with the results. I would say to all who build round silos, to spike them together as Buff Jersey says.

I started on the road as a dairyman five years ago and received $35 per cow, last year $72, and now have some promising half-blood Holsteins and expect our little scrub dairy to keep improving.

Bradfort, Vt. G. W. E.

It is a good deal like "carrying coals to Newcastle" to offer suggestions for feeding cows to a man who has brought up the annual average income per cow from $35 to $72 in five years. We do not hesitate, however, to advise feeding the silage so sparingly, if possible, as to have a fair amount left over for use next summer when the pastures begin to fail. It follows that when the allowance of silage is cut down, there must be a corresponding increase in the amount of hay fed, estimating 2½ lbs. of silage the equivalent of 1 lb. of hay. In addition to the silage and hay, we should expect to feed an average of about 8 lbs. of grain, and would make half of this out of the dried grains, if they prove to be entirely palatable. Otherwise, substitute the gluten feed. The balance may be made up of ground corn and bran. And, equally important, do not omit the daily allowance of salt.

Holstein-Friesian Breeders Third Semi-Annual Consignment Auction Sale
414 South Clinton Street, Syracuse, N. Y.,

WEDNESDAY, OCT. 28th., 1903

I am instructed by the following well known breeders to catalogue and sell on the above date one of the most selected and choice lots of Holstein-Friesian Cattle ever yet offered to the public, consisting of cows and heifers with A. R. O. butter records ranging up to and over 21 lbs. each. Young bulls, cows and heifers whose dams have A. R. O. butter tests ranging up to 25 lbs. These choice females and several others bred to such noted bulls as Mercedes Julip's Pietertje Paul, Beryl Wayne's Paul De Kol, De Kol 2nd's Butter Boy 3rd., Mutual Friend 3rd's Paul, Johanna Rue 3rd's Lad and Sir Korndyke Manor De Kol. The contributors are A. A. Cortelyou, Neshanic, N. J.; F. P. Knowles, Worcester, Mass.; T. A. Mitchell, Weedsport, N. Y.; H. L. Bronson, Cortland, N. Y.; Stevens Bros., Lacona, N. Y.; H. A. Moyer, Syracuse, N. Y. Communications and applications for catalogues, which are now ready, can be addressed to either of the contributors, or

W. C. HUNT, Sales Manager, Liverpool, N. Y.

The above breeders will hold their next Auction Sale on the New York State Fair Grounds, Syracuse, June 2 and 3, 1904, the two days following the next annual meeting of the Holstein-Friesian Association. This will be made a regular annual event.

The Ohio Dairy School

Is the name given to a Special Winter Term's Course in Dairying at the **OHIO STATE UNIVERSITY.** This course has recently been extended and improved. A handsome Illustrated Bulletin which tells all about it will be mailed free.

THE CLASS IS LIMITED TO FIFTY

Those wishing longer courses of dairy work can find them here.

A group of students have entered this fall to take Special Dairy Studies during the College Year of Nine Months. Address

BALTIMORE MARKET.

BALTIMORE, Md., Oct. 1.—Butter—There is little if any change to note in the condition of the butter market since our last report. The receipts of creamery, while gradually on the decrease are equally as large as could be expected at this time of the year; the demand just at the present is confined principally to local consumption, which by the way continues very good, particularly for extras and fine firsts. There has also been fair demand from out-of-town buyers and strange to say their orders are always confined to the finest grade of creameries: hence, the receipts of extras and firsts are kept well cleaned up, while the under grades are working out rather slowly at irregular values. All offerings of choice to fancy imitations meet quick sale. Ladles—The supply is fully equal to the requiremeuts. Packing stock—All fresh sweet arrivals meet ready sale, while rancid and cheesy lots are slighted and have to be sold, in many instances, at reduced prices in order to induce buyers to take hold. Prints and blocks—The varied offerings are fuliy equal to, if not in excess of, the demand. The general market, while not over-active, closes in good shape and firm on all desirable stock.

Creamery Separator, extras, 22@22¼c: firsts, 21 21¼c: seconds, 19@20c. Imitation Creamery, extras, 20c; firsts, 18@19c; seconds, 15@17c. Iowa & N. W. Ladle, extras, 17c; firsts, 15¼@16c; seconds, 14@15c; Ohio & Indiana Ladle, extras, 16½c; firsts, 15@16c; seconds, 13@14c¼. Ohio Store-packed, Firsts, @13c; Seconds, 12@12½c; W. Va. store packed firsts, @13c; seconds. 12@12½c. Creamery blocks (2 lbs.) extras, @24c: firsts, 21½@22c; seconds, 19@21c. Creamery prints(¼ lb.) extras, 24¼c; firsts, 23@24c; seconds 19@22c. Md. Va. & Pa. prints, extras, 22@23c; firsts, 20@21c; seconds, 18@19c. Renovated Butter, extras, 18c: firsts, 17c; seconds, 15@16c.

Eggs—Although the market has ruled firm ever since our last issue and the receipts of so-called fresh eggs have been rather light, the supply has been about equal to the demand at 25 cents. For the simple fact that the existing high prices have retarded the sales no little, a great many of our dealers are working exclusively on fancy storage stock, which they claim is giving good satisfaction. There is a vast difference between strictly fresh and so-called fresh, but it seems to be quite difficult to convince some shippers of the fact, but the sooner they become convinced the better it will be for them.

301 Exchange Place. G. M. LAMB & BROS.

NEW YORK MARKET.

NEW YORK, Oct. 3—Butter—Receipts for the week, 47,737 packages.

Exports for the week, 1,759 packages.

Arrivals are largely in excess of last year, and while we are having a good, healthy trade from all quarters, prices were marked down a half cent on extra goods and at the close there were free offerings and prices in buyers' favor. New York dairy butter in very light supply, finest tubs selling at 20c; poor to good lots at 16 to 18c. Ladle butter is quiet, but holders are firm. We quote:

Creamery, fresh, extra, 21c; medium, 20@21c; poor, 15@19c. Creamery, freezer, extra, 21c; medium, 19@20c. Dairy, extra, 20c; medium, 17@19c; poor, 14@16c. Ladle, extra, 17@18c; medium, 15@16c; poor, 14@16c. Renovated, extra, 18c; medium, 15@16c; poor, 13@14c.

Cheese—Receipts for the week, 38,249 boxes. Exports, 8,397 boxes.

Our market is just the reverse of last week; then trade was active. prices advancing, and stocks well cleaned; this week there were plenty of offerings of all grades cheese and large parcels are going over unsold, although receivers were willing to shade prices to be quit of stock. Skims suffered most and were hardly salable at any reasonable price. We quote:

Full Cream, extra, 12@12¼c; medium, 11@11¾c; poor, 9@10c.

Eggs—Receipts for the week, 44,585 cases.

New laid eggs are scarce and wanted at outside quotations, and all good, sweet, useful stock is in fair demand and prices in buyers' favor. We quote:

New York & Penn., finest new laid, per doz. 27
Northern & Western, finest, new laid, 25@26c; all sections, poor to good, 18@24c.

PRIZE WINNING BUTTER

De Laval Made as Usual

The reports from the different State Fairs now being held show the almost universal use of DE LAVAL machines in the making of the very finest quality of butter, just as for fifteen years past.

A few of the most important returns received within a few days are:

NEW YORK —E. F. ROWLEY, Kennedy, N. Y., - - 98%
IOWA— — —C. D. ELDER, Manchester, Iowa, - 98¾%
WISCONSIN —A. V. GROW, Whitewater, Wis., - - 98½%
MINNESOTA—L. LOHNBAKKEN, Butternut, Minn., - 97¾%
SIOUX CITY—M. Sondergaard, Hutchinson, Minn., 98¾%

The separator does not make the butter but it has much to do with the condition in which the cream goes to the buttermaker, and it is in this, as in every other feature of separator practicability, that the DE LAVAL machines are so markedly superior.

A DE LAVAL catalogue—to be had for the asking—will make plain the difference between separators.

The De Laval Separator Co.,

Randolph & Canal Sts., CHICAGO.
1213 Filbert Street, PHILADELPHIA.
9 & 11 Drumm St., SAN FRANCISCO.

General Offices: 74 CORTLANDT STREET, NEW YORK.

121 Youville Square, MONTREAL.
75 and 77 York St., TORONTO.

Chicago the Wonderful. The International Live Stock Exposition, One of the Features of the City and the Greatest Exhibition of its Kind in the World—Chicago no sooner gets the Centennial Celebration of the past week out of the way, than she begins to consider means for making the International Live Stock Exposition, to be held this fall, better than any ever held in the past. This, for Chicago, is not difficult to accomplish, for over $33,000,000 of live stock was handled at the Union Stock Yards last year, almost three hundred thousand car loads of live stock being received at the Chicago market during this period. This makes the city one of the greatest live stock centers in the world.

The International Live Stock Exposition has been an educational agency of the greatest value to those who have visited the show in recent years from the cattle ranges and feeding grounds of the west. These sources of supply are placed within easy reach of the city by such trunk lines of railway as the Chicago & North Western, which brings to Chicago each year 70,000 carloads of live stock, raised and fed in the territory it reaches. The people living in this rich agricultural region, tributary to Chicago, are evincing each year more interest in the betterment of their stock. The exhibition at the Union Stock Yards during the International Exposition this fall will be one of the most notable ever seen, and its chief value will be along educational lines, looking to the improving of breeds and raising of standards, which means just so much more money in the pockets of the producer.

Full particulars as to the program of the International together with announcement of low railway rates via the North-Western line will appear later.

Very Low Rates to San Francisco and Los Angeles, Cal.—Via the North-Western Line. Excursion tickets will be sold Oct. 8 to 17, inclusive, with very favorable return limits, on account of convention of American Bankers' Association. Apply to agents Chicago & North-Western Ry. 33-4

Homeseekers' Excursions to the Northwest, West and Southwest, and Colonist Low Rates West—Via the North-Western Line. Excursion tickets at greatly reduced rates are on sale to the territory indicated above. Standard and Tourist Sleeping Cars, Free Reclining Chair Cars and "The Best of Everything." For dates of sale and full particulars apply to agents Chicago & North-Western Ry. 53-sp

Very Low Rates to Detroit, Mich.—Via the North-Western Line. Excursion tickets will be sold Oct. 14 to 17, inclusive, with very favorable return limits, on account of Christian Church National Conventions. Apply to agents Chicago & North-Western R'y. 35-2

Answers to Dairy Questions by Prof. Farrington.

(Continued from page 771)

ing the samples by forcing it into the milk in the weighing can so that the tube fills to just the height of the milk in the can is theoretically a more accurate way of sampling than by simply dipping with a small tin cup. You can probably get a milk thief or sampling tube from the dealers in creamery supplies, and I am sure you will find it to be entirely satisfactory.

STARTING A CO-OPERATIVE CREAMERY.

"The farmers in this community are about to organize a co-operative creamery which is to consist of one skimming station with a capacity of 3,000 pounds per hour and a full creamery with a capacity of 3,000 pounds per hour, the latter to be fitted with machinery large enough to handle the milk of both places. Will you give me some idea of how much the machinery will cost, the size of building required and what company you would recommend us to deal with? A man is around here trying to sell stock to start a creamery, and any advice you can give us will be thankfully received as this is a new venture for us. He wants us to raise $4,000.00, but I think he is about $1,000 too high. What is the smallest amount of milk per day that a creamery can profitably handle at 3 cents a pound for making the butter?

Mt. Morris, Wis. E. G. K.

The plan which has been successful in many places where co-operative creameries have been organized is to prepare specifications of a factory, which will be appropriate to the locality. Assistance may be obtained in making such plans from the catalogues of creamery supply firms. A committee of inspection may be sent to visit factories and after their return plans may be made from such information as they have obtained. After the inspecting committee has determined the kind of a building which will best suit your locality and the farmers whom you expect to patronize, the creamery can probably be erected economically by some local carpenter. Such a building will undoubtedly cost less than if the entire contract for building and machinery is let to some agent.

The machinery for equipping this building may then be bought by getting prices from different parties who supply such machinery. It is a good plan to make out a list of the equipment needed and submit it to various dealers for prices.

This method of starting a creamery is the most economical one I know of, and if you have level-headed business farmers on the building and equipping committee, I think you will be able to get a very satisfactory creamery.

A creamery cannot be successfully operated for a very long time unless at least 5,000 pounds of milk are received per day.

You state that you will pay three cents per pound for making the butter; 5,000 lbs. of milk should yield 225 lbs. of butter; this at 3 cents per pound for making is $6.75 per day for running expenses. You cannot expect to meet all the expenses of running a factory for less than this figure. As your milk supply increases the cost of making will naturally be reduced as you can manufacture the butter from 10,000 pounds of milk for less than twice as much as it costs to handle 5,000 pounds.

I think it will pay you to put this matter of starting the creamery into some good man's hands and let him devote his entire time and thought to the subject until the enterprise is in good running order. Some one of the farmers who expects to patronize the factory may be able to do this. If the farmers in general have confidence in him and in his ability to go ahead with the enterprise, you will find that it will be money well spent to pay him a liberal sum for doing the work.

You can get plans which may be studied in anticipation of building your creamery from the dealers in such supplies advertising in this paper.

I have heard of the man whom you mention and think he is an agent for a reliable creamery supply house. He has built a number of creameries in different parts of the state, and so far as I know he is a safe man to deal with. I think, however, that it will be a good plan for you to write to the owners of creameries which he has built in the past. They will probably give you a better idea of his dealings than I can.

STARTER MAKING.

You will please favor me by giving me some information about making starters from milk.

Lyons, N. Y. L. L. H.

The starters used for ripening cream are of two kinds, first, those made from pure cultures of bacteria, which may be bought from some laboratory or dealer and are called "commercial starters," and, second, the natural starters which are made from skim milk or whole milk.

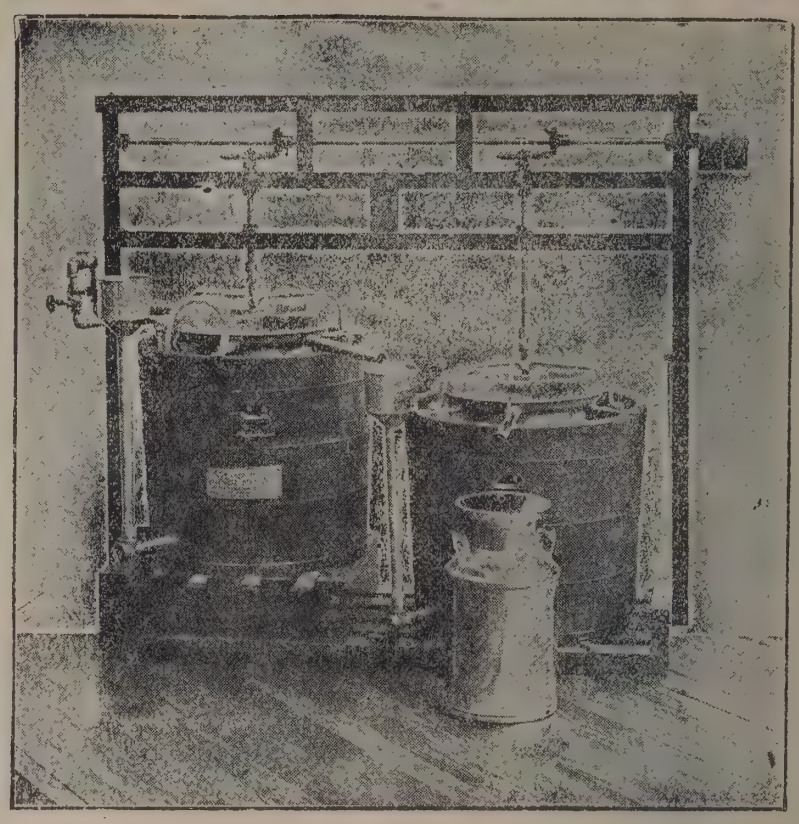
The foundation material for both kinds of starters is usually skim milk. This is first freed from most of its bacteria by heating it to 180°F. or above, for at least one half an hour. It is a good plan to keep this hot milk well stirred and covered while it is being heated. After this period of heating, the skim milk is cooled. The cooling is usually done by setting the can of hot skim milk into cold water. The quicker it is cooled, the better. When the temperature of the skim milk reaches 80°F., it is then in condition to receive either the pure culture which has been bought from the dealer, or the sour milk which has been selected and allowed to sour naturally.

The so-called commercial starters are made by adding to about a gallon of this skim milk a small quantity (about an ounce) of the pure culture which has been bought from a dealer in this material. After the pure culture has been added to the skim milk the mixture is kept at a temperature of about 80°F. until the skim milk has become soured by the pure culture bacteria. This preparation is some times called "startolene" and it may amount to about four quarts of sour milk. This is added to a larger quantity of pasteurized skim milk which has been prepared by heating and cooling as previously described and the mixture is allowed to stand at a temperature near 80° until it becomes sour and has an acidity of about six-tenths of one per cent. If the cream in which the starter is to be used is now ready, the starter may be added to it in about the proportion of ten pounds of starter to one hundred pounds of cream. A small quantity of this starter is saved each day and added to a new lot of pasteurized skim milk. In this way the starter is carried on from day to day and a new lot for use in ripening cream is prepared every day.

The natural starter is made in exactly the same way as the commercial starter except that in place of the ounce of pure culture which is bought from a dealer, a small quantity of selected sour milk is added to the pasteurized skim milk. The starter is then built up from this mixture as before described.

This in general is an outline of the methods used for making cream ripening starters. The successful handling of starters depends entirely on the carefulness with which the skim milk is pasteurized and the skill used in protecting the starter from outside contamination by dust, dirty cans, etc. In some cases the butter maker often goes so far as to wash his hands before handling his starter. These refining precautions used to protect the pure culture and the starter from contamination are very important.

If the starter does not give satisfactory results, it is best to throw it away and begin a new one, but when once obtained, a good starter should be propagated from day to day as long as possible and the length of time which it may be kept pure depends on the care with which it is made from day to day.



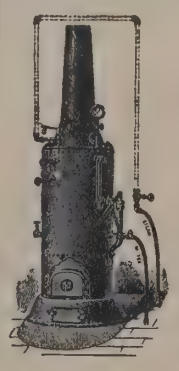
It is always better to seed a new lot of pasteurized skim milk with a portion of fresh starter taken out just before it is poured into the cream, than to attempt to propagate a new starter every day by means of butter milk obtained from a churning of cream in which the starter was used. A buttermilk starter may often give good results but as a rule it cannot be depended on because some unpleasant flavors may develop in the cream during its ripening. These, of course, are carried into the buttermilk, and when this is used for making the next starter, the unpleasant flavors may be continued in the butter from day to day.

One of the important elements in starter making is the ability to detect a satisfactory starter when it is made. A person with a keen sense of smell and taste is able by inspection to select a good starter and know that it will produce good results, while other persons without this ability are unable to accurately judge between two different starters and they may keep on using a poor one day after day without knowing it. This faculty of judging starters may be cultivated by practice and the butter maker who is most successful in training himself to detect a good starter and a poor one as well, will be the most successful in making butter of a fancy grade.

A CHURNING STATION.

We are going to build a co-operative creamery and are undecided about how to build it. Some of the farmers want to put a separator in the creamery, but most of them have hand separators

A GREAT SUCCESS.



The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

THE MILLER PASTEURIZING MACHINE CO.

CANTON, OHIO.

CLIMAX MILK CAN WASHER

A LONG-FELT WANT SUPPLIED

WHY wash cans in the Creamery by hand when it can be done by steam or other power? The CLIMAX washes the can outside as well as inside. It saves time and extra help. An expert can wash 175 cans an hour. It is a money saver for the wide-awake creameryman. Buy one of these machines and you will never regret it. A postal will bring additional information, prices, and a copy of our illustrated catalogue. Write today.

I will make you a quotation on anything you want or request.

and I presume the number of these machines used by the patrons will increase. Would you advise us to build and put in a power separator in our creamery or would it be best to build on the hand separator plan, making simply a churning station? We will probably get hand separator cream from at least three-fourths of the farmers.

How much difference in cost will there be between a creamery building with the necessary machinery for taking care of the milk of 400 cows on farms where hand separators are used, and another one which will have in addition to this cream the milk from about 150 cows to be skimmed at the creamery? We would like to have the figures as near as possible to show at our next meeting.

Westby, Wis. J. M.

I think the proposition you have before you is one that may be best decided by building the creamery so that it will accommodate all the machinery and appliances necessary for running a separator in the factory. It may not be necessary at first to use the separator, but we can not always tell what may happen in the future and the fondness which farmers have at the present time for hand separators may not last many years. In case it does not they will want to bring milk to your factory and have it skimmed there as has been the practice in former times. If you erect a building so as to accommodate a separator now, it may not be necessary to buy one at the present time, but the building will not cost much more than if you simply equipped it with a boiler, engine and churning outfit.

If you build simply a churning station and never expect to put in a power separator at the factory, the building does not need to be so large as the modern separator creamery. All you would need at a churning station would be a gasoline engine for running the churn, a small boiler (2 to 4 H. P.) for heating water to clean up with around the factory, a good size cream vat, a combined churn and a good refrigerator in the building. In addition to this you will need some fittings, such as a Babcock milk tester, butter-printing apparatus and a few other supplies, such as butter salt, color and packages.

The power separator will cost $500 and the milk heater, milk vat and milk pumps, together with the difference in the size of boiler that would be needed for running a separator creamery rather than simply a churning station, would all amount to something like $1,000. This amount I think you could save by building a churning station instead of a fully equipped separator creamery.

I think such churning stations are not very common at the present time, but if the tendency of farmers to separate the cream at the farm is to increase in the future as it has in the past, I have no doubt but such establishments may increase in number during the next few years. You can get plans of creamery buildings and an estimate of the cost of equipment needed for starting such an enterprise from the dealers in creamery supplies. These firms have catalogues illustrating the plans of creameries and I think if you will write them they will be glad to send you their publications and give you all the information you need for starting your factory.

Some Facts Concerning Alfalfa From the State of Washington.

The *Chicago Record-Herald* prints the following:

The hay crop of Washington is being harvested and baled for the commercial markets of the Northwest. Estimates place the yield at 800,000 tons, a little more than the crop of 1902. About one third of this will come from the alfalfa fields. The remainder consists of timothy, wild grasses and wheat hay. Buyers are offering $5 per ton for alfalfa in the stack, and $10 baled on board the cars. These prices are the highest ever known at harvest time in the history of the Northwest.

Washington farmers never plow up a field of alfalfa. It is too valuable for exchanging to a cultivated crop. With but little outlay they realize from $20 to $40 per acre every year. The plant has been grown on the same land for a quarter of a century without any signs of decreasing fertility or annual yields. It supplies summer pasture for hogs and cattle and the winter forage for all kinds of stock. Poultry fatten on the leaves and bees make money from the blossoms.

The stock feeder reckons a ton of alfalfa to be worth not less than $10 for feeding purposes. The dairyman places the value at an advance of two dollars per ton. For the general farmer it has the feeding and fertilizing values that combine to make it the most profitable crop that can be grown on the farm. Buyers have attempted to get a corner on the entire output of the state in order to sell it again to stock feeders for fabulous prices. This has been stopped after about one-seventh of the crop was contracted.

Much of the alfalfa hay of central Washington is shipped to the markets of China and Japan. Some goes to the Philippine Islands, and a portion to the gold fields of Alaska. It is put in bales of 100 pounds each and shipped on the ocean vessels. About 300 car loads of this year's crop have been sent out from the Yakima Valley. Last year, when the snow was deep and feeders alarmed over the outcome of the winter, baled alfalfa sold for $18 per ton. In some places timothy had to be imported at a cost of $24 a ton.

Twenty pounds of alfalfa seed plants an acre. The seed has an oily coating which protects it from heat and cold and prevents it decaying in the ground. No crop can be secured the first year after planting. The second year will give two fair crops and fall pasture. In pasturing a field care must be exercised in not giving stock the free range early in the morning when dew or frost is on the plant, as it causes them to bloat.

Alfalfa hay is cut when the plant shows blossoms over the field. If neglected a few days the stems become woody and the feeding value depreciates. In the West the grass may be cut in the morning, raked in the afternoon and stacked the second day. Ordinarily this is not done, as there is never any rain in an irrigated country during the time of harvesting. In the Yakima Valley the moisture precipitation for the entire year does not exceed eight inches.

Has a Surplus of Corn—Calves Die, Cotton Seed Meal Probable Cause.

ED. HOARD'S DAIRYMAN:—What can I do with my corn to get best results? Am only commencing the business; built a round silo, and planted corn to fill it, but when I came to fill, the 100 tons only took a little over half of the corn. The rest (75 tons) I had cut on account of frost and stood in the field to make. Corn matured about right for table green corn. Should I feed it in the stalk or cut or shred it?

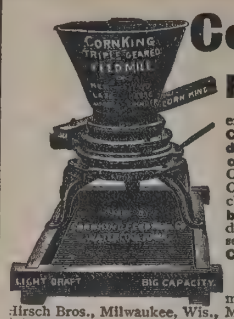
Also can you give any cause for loss of calves. I commenced raising my heifers in March on separator milk; after two weeks old, gradually reduced new milk, till at three weeks they were on separator milk. Then I cooked a tablespoonful of cotton seed meal for each calf and stirred it in the milk. They were kept scrupulously clean and all dishes clean. They did finely till two or three months old on hay and water, and kept each in a pen in a light, well ventilated barn. One, about June 1st, refused his feed; seemed to breathe as if he had trouble with throat, and died in 24 hours; in a few days another the same.

When first one died I stopped all but milk, and made that half hot water. When four had died in about three weeks, I sent a good veterinarian to investigate. He looked over everything and said he could find no cause. Three more died, making seven of my best ones in about a month. They did not bloat. One died in two hours and the others each in about twenty-four hours. Can calves be raised on separator milk? If so how?

I sent you several subscriptions last spring for my neighbors and paid for them out of my pocket. If every reader of the DAIRYMAN would do likewise many farmers who are heavily incumbered would soon get out of debt.

Bar Harbor, Me. C. C. M.

This surplus corn should make excellent fodder, if it was not too much injured by frost. It may be fed in either of the ways suggested, but there will be least waste, if it is shredded. The only question is whether the saving will pay for the extra expense involved. If one has the machinery and the power to run it, we would unreservedly advise shredding; but if fodder is over plenty and cheap, it probably would not pay to purchase or hire machinery and power for this purpose. Cutting in short lengths closely approximates shredding, and if the cut fodder is mixed with the silage twelve hours or more previous to feeding, there will be but little of it rejected. If not mixed with the silage, it is a good plan to cut a week's supply in advance, dampen, and let lie in a pile to heat and soften.



The probabilities are that the cotton seed meal caused the death of these calves. Just why or how is difficult of explanation, but that it is frequently fatal when fed to calves or pigs has been too often observed to admit of question. Calves can be successfully raised on separator skim milk. The present writer has been doing this for years. At first it is a good plan, although not absolutely necessary, to add from a teaspoonful to a tablespoonful of ground flax seed to each feed, first scalding the meal to a jelly. Later, as the calf's stomach develops more power, oat meal may be substituted, and a little later whole dry oats. Very early in its life the calf will nibble at hay. Let it have all it will eat, but give it fresh every day. Recently, also, a very small amount of blood meal daily has proved a very satisfactory practice.

Indiana State Fair Butter Scores.

For several years Purdue University has operated a working dairy at the Indiana State Fair. Each morning and afternoon separators have been run, butter made and milk tested by students from the dairy department under the supervision of the Professor of Dairying. This year was no exception.

The quarters have been remodeled some and fixed up so as to allow the display of a large number of charts, giving much instructive data. As people spent a good deal of time watching the work, these charts attracted considerable interest.

Subscribe for both papers for 1904, at the lowest clubbing rate, $1.75 FOR THE TWO. To make it plain, send us $1.75 and we will send THE JERSEY BULLETIN and HOARD'S DAIRYMAN to January 1st., 1905.
"IT'S UP TO YOU!"

tilily in various farm crops, records of individual cows, an illustration of balanced rations, etc., occupied the space. These often furnished an excuse for questions on the part of those watching the work so that the middle of each day was a continual question box with answers by those in charge.

A new feature was three columns of print butter, containing in the first case, the actual number of pounds of butter made by the average cow of the state, as shown by the census, which is 140 lbs. The second column contained 300 lbs., and was labeled: "The amount of butter a good cow should make," and the third column contained 374 lbs., and was the amount of butter made by one of the University cows at a feeding cost of $46. The relative size of the columns attracted attention and undoubtedly set a good many people to thinking.

The following are the scores of butter and entries:

BUTTER.

Osborne on the Cow.

While some of the lands in the drier sections of the Dakotas are selling for much more than they will ever be worth for farming purposes, the greater part of her moister lands are not selling too high, and there are good reasons why they are not.

The secret of some of the reasons for the state's remarkable progress is told by O. M. Osborne, of Howard, one of the shrewdest observers in South Dakota.

"When I came to South Dakota eleven years ago," says Mr. Osborn, "this section of the state was an exclusive wheat country. Farmers kept one or two cows, often not making enough butter for the family table. One would rarely see a herd of cattle or a flock of sheep in a day's drive. Wheat fields, acres and miles of them, stretched away on every hand. The invariable result of planting the same crop on the same land year after year was aggravated by the series of dry seasons and by declining prices. With his income cut off or reduced the farmer was driven to mortgage his land. Many of them lost their homes. Others struggled along under loads of debts that were almost hopeless. The mortgage shark and the machine fiend made life a burden to them.

"Then the cow came and rescued the farmer. A few at first turned their attention to home dairying. They prospered and others followed their example. Herds began to dot the landscape, living, sleek and fat, on the rich grasses which had hitherto gone up in smoke from the prairie fires which at intervals swept over the plain. Creameries were built and herds multiplied. From small beginnings the dairy quickly became one of the leading industries of the state. Mark the result: Lands which were sold under mortgage foreclosure a few years back for $4 to $5 per acre, with the judgment creditor usually the only bidder, are eagerly sought after at $15 to $25 per acre, and contented farmers are reaching out after adjoining quarters everywhere."—*Dakota Farmer.*

TYRANENA HERD

100 HOLSTEIN-FRIESIANS 100

A. R. O. Stock For Sale.

Both sexes, all ages. Herd headed by Sir Piebe Hengeveld De Kol, No. 27929, dam Piebe Laura A. R. O., 21 lbs. 8 oz. Average percent fat 4.6a. Eight official records in pedigree that average 23 lbs. 5 oz. Frank B. Fargo, Lake Mills, Wis.

LOOK HERE

34 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs. of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs. of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Gem Pietertje Hengerveld Paul De Kol, or Sir Ormsby De Kol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days; average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd?

For particulars address H. B. Daggett, Mgr., Station A, Milwaukee, Wis. Residence: National Ave., near 40th. Phone, South 1601.

HOLSTEIN-FRIESIAN YEARLING BULLS

ready for service, of high quality and breeding, at low prices for the next sixty days. They are from such families as Sadie Vale Concordia, Korndyke, De Kol Burke, Clothilde, Netherland, etc. Also choice heifers.

Smiths & Powell Co., Syracuse, N. Y.

In Prince Edward Island.

ED. HOARD'S DAIRYMAN:—The only fair we attended this year was the Prince Edward Island Provincial fair, which took place at Charlottstown, Sept. 21-25. We were more than usually interested in this fair from the fact that we entered our little scrub heifer, and a number of our Tamworth hogs. On this account we had to be on the grounds a part of every day of the fair. The weather was beautiful and fair for the first three days, but on Thursday, the principal day—the day upon which the railroads and steamboats granted unusually liberal concessions, and "the big day," it rained in torrents from noon until sundown, and the thousands of people who came in to see the fair on this particular day did not see it at all, and which meant a loss in gate money to the fair managers of probably $5,000. This was a great disappointment all around, to the people as well as to the fair, and probably means a deficit for the fair managers of this year's exhibition.

The different classes of live stock were well filled. In fact the ordinary shed room could not accomodate more than three-fourths of the live stock. This was more noticeable in the dairy stock, and makes it appear that Prince Edward Island dairymen are making an effort to infuse considerable pure blood into their herds, and also that there are a very great many of fine grade dairy stock in the province. For the past few years the great drawback to successful dairying in the Island appeared to be the paucity of really good dairy cows.

Dairymen were feeding a lot of cows that never were able to pay their board. The owners of these animals found that increased feeding of meal foods, roots and silage, did not pay, and in disgust, many of them reduced their herd and lost their enthusiasm in dairying, with the result that dairying has been going down in this province for the past three years.

This year has apparently been the "parting of the ways." Another supreme effort has been made. The *sine qua non* has been found out. The dairymen are breeding and feeding better dairy cows, with the result that the dairy business on the Island this present season is going to be better than for three years back. Dairying is now on a more solid foundation.

The fundamental principles of dairying seem to be understood by the Islanders at least. They do not appear to think any more that just feeding alone will fill the milk pail. It appears to be understood that the right machine must first be procured—a machine that will give the greatest motive power with the least expenditure of fuel. As everybody knows, coal is high, but no higher probably, in proportion, than bran, ground oats, and oil cake—the fuel required to run the lacteal machinery for the dairy cow, and elaborate milk.

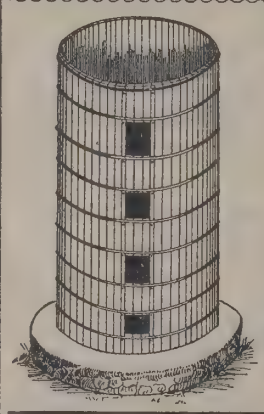
These, then, we imagine, are some of the chief causes or incentives, to the large number of grade dairy cattle to be seen at the Prince Edward Island exhibition this year, and the apparent marked increase in pure bred dairy sires in the country.

In an essentially Dairy Province like Prince Edward Island it is not to be wondered at that the exhibit of dairy cattle was very large, and the predominant feature of the show. In this class the sheds would not accomodate nearly the numbers on the grounds and temporary quarters had to be utilized out side—machinery halls, empty hog pens, sheep pens, and any old place. No doubt another year increased accomodation will be furnished as the fair has grown completely out of its swaddling cloths. T. D. Mc Callum, Danville, Quebec, judged the dairy cattle. Ayrshires were in largest numbers. The shed accomodated twenty-six, while the numbers quartered elsewhere could not be arrived at. There were some very fine specimens of the breed represented, and among so many good ones, comparisons seem to be odious indeed. Caston Bros, appeared, however, to be the chief Ayrshire exhibitors, although there were many others who showed smaller herds of probably equal merit.

The Jerseys, while largely represented, were nothing extra; many of them were ill fitted and scrawny looking. With the advent of the creamery the pet-Jerseys of the city people are no more in evidence. A few years ago many people in the cities made their own butter and used their own cream, and as they kept but one or two cows for this purpose, they were kept well and made family pets of. Now, however, this is changed. The people now use creamery butter, and the pet Jersey which used to adorn the Jersey sheds at the provincial Fair is now a thing of the past. The few Jerseys that are here are in the hands of the dairy farmers who do not usually pet and pamper their stock, hence the passing, to some extent, of the Jersey at the Prince Edward Island show—at least so it appears to the impartial spectator.

Guernseys were represented by eight head in the pure bred class, and were owned, apparently by one solitary individual who had everything his own way. These cattle were shown in admirable condition and were one of the most attractive features of the dairy live stock show.

In Holsteins the number on exhibition was by no means large, but what was lacking in number was more than made up in quality. The two-year-old bull, imported some time ago from Ontario, was, in itself, worth going a long distance to see. Though only a little more than two years, he weighs 1,800 pounds, and is as live and active as a kitten, with no apparent surplus flesh either. This animal would be a worthy and likely competitor at St. Louis, if his owner sees fit to show him there, considering his splendid dairy conformation, withal.



In dairy grades the number was very

A Bad Fix

When one wakes up aching from head to foot, and with the flesh tender to the touch, when

Soreness and Stiffness

makes every motion of the body painful, the surest and quickest way out of the trouble is to use

St. Jacobs Oil

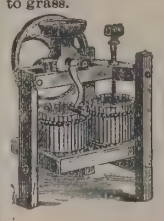
promptly. It warms, relaxes, cures. Price, 25c. and 50c.

Clark's Tools for Large Hay Crops

CLARK'S REVERSIBLE

Bush Plow and Harrow
Cuts a track 5 ft. wide, 1 ft. deep. Connects the sub-soil water. It is an excellent machine for covering in sugar cane. Strength guaranteed. Can plow a newly cut forest, stump, bush or bog land, leaves the land true and clean for grain or any crop.

Clark's Dbl. Action Cutaway Harrow
Moves 15000 Tons of Earth a Day.

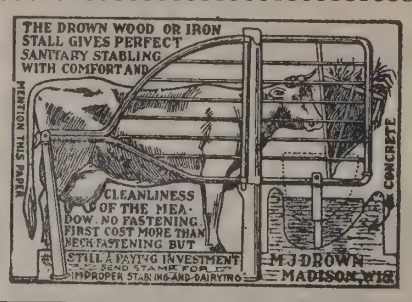


Clark's 8 foot Smoothing Harrow.
Will smooth an acre as true as a mill pond in twenty minutes.

Clark's Rev. Sulky Disk Plow

Made single or double. One or two furrows five to ten inches deep; 14 inches wide. For two or four horses. Light draft. No side draft. No similiar plow made. When Clark's grass tools are used as directed in his grass circular, we, the C. H. Co., guarantee them to kill wild mustard, charlock, hard hack, sunflower, milk weed, morning glory, Russian thistle or any other foul plant that grows, or money refunded, Now is the time to commence work for next year's seeding to grass.

CLARK'S CIDER MILL



Horse, Hand, or Steam Power. From five gallons to eight barrels.

PERFECT GRIND

Will grind 75 bushels per hour easily.

Send for Circulars.

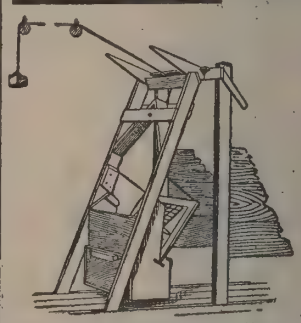
O. H. ROBERTSON,
Forestville, Conn.

Prescott's Swinging Swivel tanchion
Keeps Cows Clean.
Swings forward while getting up or lying down. Looks back while standing Full particulars free.
E. PRESCOTT,
Beverly St., Boston, Mass



WARRINER'S CHAIN HANGING STANCHION.
CLEAN, SAFE, COMFORTABLE.
MFG. BY W. B. CRUMB, Forestville, CONN.

This Taylor Stanchion

is made of angle steel lined with hard wood on side next the animal's neck. It is lighter, neater and stronger than any other stanchion made. Swings on chain at top and bottom and admits of greatest freedom of motion. Cattle can lay with head on side. Easiest opened and closed. Reliable Agents Wanted. Write for special terms, prices, etc.
JAMES BOYLE, SALEM, O.

JUST OUT! UNDERHILL SELF ADJUSTING STALL

No Gutters
No Platforms
No fastenings
No Stables to clean
Cease trying to keep your cows clean. You can't do it. Give them a chance and they will do it themselves. This is the only way and the easy way. Write for circular telling what the cow has discovered to us. It is a great revelation.
Wm. M. UNDERHILL, Oconto, Wis.

WILDER'S PATENT SWING STANCHIONS
Chain or Pin Fastened.
Are self adjusting and noiseless. Fasten themselves open when animal is out; swing freely when latch is closed; opened and closed without removing mittens or gloves; keep cattle clean with most freedom of motion; blind bolted and cannot get loose in joints; made of best selected hardwood and furnished with chains or pins as desired.
Safest, Strongest, Most Convenient fastening made. Cheapest to put in and save room in barn. Send for Stanchion Catalog to
WILDER-STRONG IMPLEMENT CO., 11 Monroe, Mich.

Foster Steel Stanchion
made entirely of steel and malleable iron. Unlike all others. Affords greatest freedom and motion and always holds the animal. Hung on chains—moves all ways. Lightest, strongest, most convenient and easiest to open and close.
GOOD SELLER—BIG PROFITS.
One agent sold 75 first day, Another sold 200 first week. We want responsible agent in every Dairy Community. Send for circular number 30.
FRANK H. BATTLES, Seed Grower,
Rochester, New York.

THE NEW PATENT
Cow Stall
AND FEED TROUGH.

This is the only Cow Stall with a centering hinge. Stalls all fold back to manger as the cows go out the barn. When ready for use, by starting one stall all come into position. No post at the gutter. Send for circulars.
R. A. McLERY & CO.,
Palmyra, Wis.

large. Each grade competed together, there being no general competition. The Jersey grades competed against themselves; the Ayrshires the same, and so with the Holsteins and Guernseys, which seemed a little ridiculous and of little general uitlity, were it not for the fact that the animals had to be sired by a registered bull of the recognized grade.

Among the grades were very many fine dairy cows, of good shape and dairy conformation, and to the casual observer appeared to be money-makers for their owners. "Handsome is that handsome does."

As to the quantity of milk which those cows and heifers gave a day, it is ridiculous to hear the answers some of the owners give one when asked how much milk is such a cow giving per day. In answer to this question some men told me that their two-year-old heifers gave 60 pounds per day, some others answered 40 pounds, while some others answered 30 pounds. Only one man appeared to know how much milk his two-year-old heifer gave per day, and this was the owner of the sweepstakes two-year-old Jersey. He answered that this heifer gave 20 pounds per day and her udder conformation and development appeared to be as prominent as those who asserted that their heifers gave 40 to 60 pounds per day.

It, however, is probably not lack of veracity, but ignorance of the actual pounds of milk given by their cows per day. Though well advanced in breeding, and not having very much competition in the show ring, they do not appear to pay very much attention to the milk flow.

This appears to be the fact in Jerseys and Guernseys at least. From casual observation of the two-year-old dairy heifers of all breeds during the several days of the Fair, we truthfully believe that there was not one two-year-old heifer on the grounds that gave as much as twenty pounds of milk per day. We took particular notice of the grade two-year-olds, and we concluded that there was not any as good as our own little heifer at home, mentioned frequently in the DAIRYMAN. We paid to enter our heifer at the Fair, but was barred because our heifer was not by a pure bred sire, and ours is sired by a nondescript. Again in the milking contest, there was, strangely indeed, no class for two-year-olds. As for myself, seeing the vast array of two-year-old heifers at the Fair, I am prouder than ever of our own little heifer at home.

No doubt there is good reason for classing the grades into breeds by a pure bred sire of that particular breed, in order to give the average farmer and dairyman encouragement to use pure bred sires of the several breeds. With a good animal by a pure bred sire of any particular breed, at this Fair, the owner would stand almost as good a chance for prize money as the man with the pure bred. "A half loaf is better than no bread" seems to be the idea of the Fair directors.

The writer had his Tamworth hogs on exhibition here, and succeeded in getting two firsts and one second, which was quite satisfactory. The hog show was very fine; that of Yorkshires and Tamworths being particularly so. The Berkshires also made a fine showing. The breeders have been endeavoring to bring their hogs to the requirements of the bacon trade; that is making the back narrower, the shoulder lighter and the side deeper. In this the Berkshire and other breeders appear to be succeeding admirably. J. A. M.

Charlottetown, P. E. I.

Plan for Feeding Rack Wanted.

Would you or some of your readers give me plans for a feeding rack for corn fodder to be placed in the yard and movable? A SUBSCRIBER.

Blue Earth Co., Minn.

As we do all our feeding of cows and young stock in the stable, we are not posted on the subject of feeding racks in the yard, but if any of our readers can give this Minnesota subscriber any valuable suggestions we shall be pleased to publish them.

A New Wrinkle in Silo Construction Suggested.

ED. HOARD'S DAIRYMAN:—Just now everybody is talking silo. What's the matter with the octagon style, made of 2×4s, 8 feet long, laid flatways, with pieces of lath four inches long between each stick, and about two feet apart? These will make the grooves to clinch plastering; put in plenty 20 in. spikes, cement inside and shingle outside. The round stave silo is expensive and short lived.

I find lots of good things in your paper. Every dairyman ought to take it. About all we know we have learned from others. This county (Delaware) is one of the largest and oldest in the state as to dairying, and not one farmer in twenty takes a dairy or agricultural paper,—are just going along in the same old rut their grandfathers traveled. What a stupid lot the average farmers are. All other trades seem to be making the most of their opportunities.

Let your light shine. J. A. T.

Ryan, Iowa.

One must not be too positive in approving or condemning any proposed variation from accepted theories in regard to construction of silos. The plan proposed seems to be free from any fatal objections, but in the absence of carefully prepared specifications as to materials and labor we incline to the opinion that it will be more expensive than several other methods of construction.

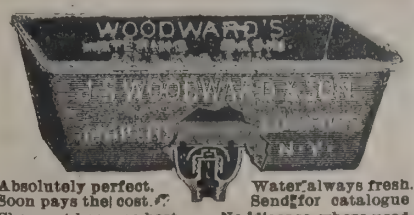
Many a child has been fooled by the story of the pot of gold which is to be found just at the foot of the rainbow, and has started out to gather riches full of happy dreams.

Many a man and woman have been deceived by the tale that there was health to be found out beyond the sunset, and they have started out dreaming of a healthful future, never to be realized.

People who have tried change of climate in vain for the cure of weak lungs have been perfectly and permanently cured by the use of Dr. Pierce's Golden Medical Discovery. It cures deep-seated coughs, bronchitis, bleeding lungs, emaciation, and other conditions which, if neglected or unskilfully treated, find a fatal end in consumption.

"Last spring I had a severe attack of pneumonia which left me with a very bad cough, and also left my lungs in a very bad condition," writes John M. Russell, Esq., of Brent, Cherokee Nat., Ind. Ty. "I had no appetite and was so weak I could scarcely walk. My breast was all sore with running sores. I got two bottles of Dr. Pierce's Golden Medical Discovery, which I believe saved my life. I cannot express my gratitude to you. I am able now to do very good work."

Any substitute offered as "just as good" as "Golden Medical Discovery" is a shadow of that medicine. There are cures behind every claim made for the "Discovery," which no "just as good" medicine can show.



The People's Common Sense Medical Adviser, a book containing 1008 pages, is given away. Send 21 one-cent stamps, for expense of mailing *only*, for the book in paper covers, or 31 stamps for the volume bound in cloth. Address Dr. R. V. Pierce, Buffalo, N. Y.

A Commendation and an Inquiry.

How Deep in Ground May a Silo Be?

ED. HOARD'S DAIRYMAN:—On reading the current issue of the DAIRYMAN, I am very forcibly impressed by your article, "Love the Great Solvent." It ought to be printed so that he who runs might read everywhere, and especially in dairy barns. The average man when he gets a cow's brush in his eyes is apt to say things unfit for print.

I have a Buff Jersey silo, 16 feet in diameter and 34 feet deep. It is very satisfactory, but as I want silage the year round, I am going to build another slightly larger, and I want to ask how deep in the ground silos have been made and used successfully.

My brother built a silo this season, and the underground part seems a great deal the most profitable. As soon as the digging was finished they placed a form, made in sections, 4 feet high and 8 feet long, shaped to 24 feet diameter, and filled back of them with gravel and sand mixed with about ⅛ of its bulk of Portland cement. Above ground, there had to be an outer as well as inner form, and as the pressure was greater outward than inward, we put a hoop around the outside made of a dozen strands of No. 12 wire tightened with a Page fence stretcher.

The labor of getting the forms in place, and of elevating cement and gravel makes the work go slowly, when you get far up in the air. I think the underground part would last indefinitely, and keep silage perfectly for years.

Dane, Wis. G. L. S.

We not only thank G. L. S. for his kindly and much appreciated compliment, but are glad to welcome him to the constantly increasing number of dairymen, who realize that there is a commercial as well as an ethical value in reciprocal affection between the dairyman and his cows. Not only is a merciful man merciful to his beast, but such mercy blesses him who gives as well as them that receive.

In one sense there is no limit to the depth a silo may extend in the ground, but our judgment is that, whether for convenience or safety, the bottom of the silo should not be more than six feet below the level of the feeding floor, or the first opening for removing silage.

CONCERNING OUR ADVERTISERS.

A copy of the pamphlet "Principles of Profitable Farming," is before us in a new and revised edition. The principles of proper rotation with leguminous crops and the great advantages to be derived by such methods are explained in the pamphlet in a fascinating manner. A description of the Experiment Farm at Southern Pines, N. C., where the best methods of using fertilizers are being studied and put into practice, is also a valuable feature of this publication A thorough perusal of the book would be of interest and benefit to all practical farmers and copies can be had, free of charge, by writing to the German Kali Works, 93 Nassau Street, New York, N. Y.

ORIGIN AND OBJECT OF THE GREATER GEORGIA ASSOCIATION.

Mr. John M. Stahl, editor of The Farmer's Call, in a speech to the National Farmer's Congress at Macon, Ga., last year, said the farmers of Illinois had spent a million dollars in two years, buying land in the far North West. He added that they bought it there because it was persistently advertised, and in his opinion many would have done better had they bought land in the Southern States, particularly Georgia. Among the many who read this speech was Mr. J. K. Orr, President of the Atlanta Chamber of Commerce, and one of the largest wholesale merchants in Georgia. He came to the conclusion that if it pays to advertise a nostrum of doubtful merits, it should pay better for a great State like Georgia to advertise its incomparable resources and the extraordinary advantages it offers to enterprising people Out of this idea the greater Georgia Association grew. It is an organization composed of thirty of the most progressive towns, cities and counties in Georgia, and its headquarters are in the Atlanta Chamber of Commerce. Its secretary, Mr. W. G. Cooper, now secretary of the Atlanta Chamber of Commerce, was Chief of Publicity and Promotion for the Cotton States and International Exposition, held in Atlanta in 1895. The Executive Committee is composed of fourteen of the leading business men of the State. This Association is proceeding in a systematic manner to put before the thrifty farmers of the Middle West and the business men of the great cities, the opportunities that await enterprise in Georgia.

SEND 50 CENTS to Modern Medicine Co., Dept. B., Benton Harbor, Mich., for their Wonderful Tonic Tablets, that restores health and vigor to men and pale, sickly women. Guaranteed or money returned. Valuable medicine book for 2 cent stamp.

per cent of them, failing to take up until they come in heat three or four times? H. C. K.
Tillamook, Oregon.

ANSWER.

Although there are various causes, very often this trouble follows a siege of abortion, or even if a bull has served a cow which has recently aborted, and still discharging from the vagina, and then serves a healthy cow, he may cause sterility or even abortion. It is generally admitted that the presence of abortion germs will prevent conception.

Abortion.

We have one cow in our herd (a grade Jersey) that we think has aborted, at least she comes in season every 18 to 21 days. We can see nothing else to indicate abortion. She carried her calf 6½ months. If she has aborted would she be apt to increase any in milk when her time to have freshened is up? This is the third time this cow has done this. First time aborted in 4 months; second time, 5 months; and this time 6½ months, but increased in milk the first two times. Would you advise selling her or giving her another trial? If the latter, when would be best to breed her?
Elsberry, Mo. C. H. T.

ANSWER.

We would advise to give the cow a rest, viz.: do not breed her for at least six months, so that nature will have a chance to restore the uterus to its normal condition. She may then be able to carry the calf its full time. A cow usually gives more milk after she has aborted, provided she carries the calf long enough to bring her within two or three months of the normal time for dropping the calf, but if the abortion is continued four or five times in succession, it will so weaken the system that there is no increase in the flow.

Hernia.

A mare colt about six months old has a soft lump about size of a goose egg, about a foot from the bag on the seam of the belly. Came on when she was about a week old. It looks like a rupture Should it be bandaged? W. J. W.
Riverside, Cal.

ANSWER

Your colt has a hernia which can only be remedied by performing an operation, known as laparotomy. Employ a qualified veterinariam.

Spaying.

Does it pay to spay young heifers from grade cows?
At what age may they be spayed?
Is it a dangerous operation?
Are there any publications on spaying?
Tuscola Co., Mich. E. M. O.

ANSWER.

It pays to spay heifers if you are feeding for beef, as they fatten quicker.

The usual time to perform this operation is when they reach maturity, just before they come in heat.

The operation is not dangerous if carefully performed.

For publications on this subject write Alex Eger, 2537 State St., Chicago, Ill.

WORCESTER MASS.

Mercantile and Law Printing a Specialty. Blank Books Manufactured to order.

OLIVER B. WOOD,
Printer and Stationer,
No. 50 Foster Street.

Worcester, Mass. June 11, 1903.

I have a Wilkes Pacing Gelding that became lame in the off forward foot. The soreness was just above the hoof, with a tendency to throw out a ringbone. I tried three veterinarians and various advertised remedies which were on the market but without effecting a cure. Also fired and blistered him once. My attention was called to your remedy by a friend who urged me to use it. After one month's trial and the use of one and one-half bottles, we hitched the horse up and drove him and he has never taken a lame step since. Have now been driving him six months on the road, have speeded him on the track and macadam roads and he is as sound as a bullet. It is certainly a wonderful remedy and I feel that I cannot say too much in its praise. Wishing you every success, I am yours respectfully
O. B. Wood

LEADING DRUGGIST
Dayton, Wash., Sept. 15, 1903.

Troy Chemical Co.
Troy, N.Y.

Gentlemen:-Herewith please find enclosed N.Y. Exchange for which please send me at once 1 bot. "Save-the-Horse"
"Save-the-Horse" is certainly accomplishing wonderful results in this case. The bog is all gone and the Thoroughpin is fast disappearing.
Very truly yours
J. M. Day

RIPON, WIS., July 29, 1903. Gentlemen: My horse had ringbone on right hind leg. Used blisters for nearly one year and had him fired, but to no effect other than to leave a bad scar. In April I purchased a bottle of your "Save-the-Horse" and by the time I used half of the bottle it had completely cured the lameness and is reducing the bone. Yours respectfully,
O. B. Dakin

It is the truth---actual results from business men whose standing and reliability can be readily ascertained--- which have made "Save-the-Horse" such a success. Their cured horses are living advertisements, absolute certainties as to the possibility of the remedy in your own case, and with every bottle is a guarantee document as binding to protect you as the best legal talent could make it.

"Save-the-Horse" cures without scar, blemish or loss of hair, can apply at any time, any place, and in all conditions and extremes of weather. Horses may be worked as usual with shin or ankle boots, as no harm can result from destruction of hair or scalding of limb. **Positively and Permanently Cures Bone and Bog Spavin, Thoroughpin, Ringbone,** except low ringbone, **Curb, Splint, Capped Hock, Windpuff, Shoe Boil, Weak and Sprained Tendons and all Lameness. $5.00 per Bottle.** Written guarantee with every bottle given under our seal and signature, constructed solely to satisfy and protect you fully. Need of second bottle is almost improbable, except in rarest of cases. Send for booklet and copy of guarantee. $5.00 per bottle at all druggists and dealers, or sent express prepaid.

New York Milk Producers' Meeting.

ED. HOARD'S DAIRYMAN:—The members of the Five States Milk Producers' Association, also of the Producers' Pure Milk Company, are still active, but the recent unsettled condition in Wall Street, together with some other difficulties, it is claimed, have deferred the final consummation of the companies' plans. A meeting was held at Binghamton, N. Y., Sept. 22, to determine whether more time should be given the company. The meeting was composed of the representatives of the F. S. M. P. Association for each railroad branch and of the sales committee.

There are twenty two railroad branches, or divisions, within the territory of the Association, each having a representative, and all except a few of these representatives were present at the meeting. While considerable discussion was had regarding matters in general, the only vote taken was with reference to extending the time. It will be remembered that certain individuals represented that the People's Pure Milk Company would be completely organized and would be ready to take the milk of the members of the Association at a good price by October first.

It now appears that the company is not ready to purchase milk and they therefore ask for more time. The representatives of the routes mentioned voted, so far as they have the power to do so, to extend the time, leaving the matter in the hands of the sales committee to act upon at their discretion.

How far the People's Pure Milk C ompany are from final organization could not be definitely learned, nor could it be determined how generally the farmers are signing the contracts, pledging the sale of milk to the company for the next five years. In fact, the whole affair appears to be one of some uncertainty at the present time. It is to be hoped that some good will ultimately result to the farmers who are interested. H. H. L.

Chenango Co., N. Y.

World's Fair Dairy Barns.

The contracts for the four dairy barns at the World's Fair have been let, and construction will begin at once so that the cows may be brought to the Exposition grounds before the first of the year.

Their location is at the north end of live stock site and just west of the proposed live stock forum or main amphitheater.

The barns will be uniform octagons, 100 feet in diameter. Each will have thirty-eight stalls arranged in a semicircle, with a rear promenade twelve feet wide to accommodate visitors. Eight box stalls, 8'x12' will be provided for the cows at calving time, and two box stalls will furnish quarters for bulls. The second floor will have four feed bins, each holding about 500 bushels of ground feed. Sleeping quarters for the men in charge of the cows are also provided.

The arrangement of the barns permits full inspection of the stock by visitors and of the care of the cows to the best possible advantage. Chief Coburn and Secretary Mills express themselves as well pleased with the plans.

GROOM YOUR CATTLE BY POWER

Our Improved Grooming Brushes, revolving 1200 times a minute, insure glossy coat, clean skin, active pores, health and beauty. Their use increases value of all stock. Indispensable for prize winning show cattle. Will groom 30 to 50 head an hour, and do it better than by hand. Get our Free Booklet and learn to groom your cattle, horses and all stock the best way.

We make a specialty of long range sales, so no matter how far away you live, if interested write us. We refund railway fare to parties who buy of us Send for price list with pictures of farms.
THE JOHN M. CANNON LAND AGENCY, CRESCO, IOWA.

Improved and Unimproved Farms for Sale

Farm No. 1 consists of 90 acres with frontage on a fine lake where there is excellent fishing and game. This lake is one of a chain of lakes on which you can travel for twenty-three miles. Has two-story house with eight rooms. Two-story log barn. Ice house and ten acres cleared. For sale at a bargain. One mile and a half from the railroad.

Farm No. 2. One-half mile from the railroad. 100 acres or more if desired, five acres cleared. Two-story, eight room house. Glass chicken house. First-class hog pen. Plenty of timber on land for own use, and quite a quantity of saw timber. We have besides this 16000 acres of unimproved land. Heavy black soil. All lies in Central Wisconsin. Low priced Excellent markets. Will grow any kind of crop and produce immense results. Excellent water supply. Splendid markets and a local demand for everything that is raised. None of the land lies more than three miles and a half from the railroad.

WISCONSIN FARMS

Will furnish names of people who have bought from us who have made big success. Can furnish lands in either small or large quantities. Can furnish reduced rates to see the lands. Easy terms to suit the convenience of the purchaser. As safe and desirable an investment as government bonds. Write in for maps and any information you may desire.
INTERIOR LAND CO., Janesville, Wis.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x2 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

DO YOU WANT 10 COWS?

We make the following liberal offer to any reliable farmer who buys 160 acres of land of us: We will furnish you with 10 cows, either fresh or soon to become fresh. They cost you just the market price. You sell their cream to the creamery. Every month you have the Creamery Company send us sixty per cent. of the amount due you for cream. You do this until the cows are paid for. In one year the cows with their increase will pay for themselves. After the first year they will take care of the annual payments of principal and interest due on your farm. If you buy a half section, we will furnish you with 20 cows, and so on, selling you 10 cows for every 160 acres you buy. This is the "crop payment plan" applied to stock. We expect purchasers to pay from $2.00 to $3.00 per acre in cash—sometimes we make easier terms to good men. If our plan interests you, write us.
WHITNEY & WHEELOCK, 22 Broadway, Fargo, N. D.

LACLEDE COUNTY, MISSOURI

THE KING OF THE OZARKS

Leads the World in Apples, Small Fruit and Stock Raising

Unequaled by any country on earth for all-around farming, fruit and stock. 1,400 feet above sea level. Beautiful, healthful climate; short winters, January and February. Pure air, pure water, abundant and fine range, where all grains, grasses and fruits grow to perfection. **If you want a cheap productive farm, where you can make money and enjoy living this is the place.** We can sell you at the present time **finest improved farms from $10 to $25 an acre.** Will positively double in price a year from now. Don't delay or make the mistake of buying elsewhere till you have investigated this spot, but write at once to
J. H. QUIN & CO., Lebanon, Mo., for particulars and mention this paper.

21 STRONG REASONS

WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to own a low-priced farm than to owe for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agricultural districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.
WISCONSIN BLUE GRASS LAND CO., Baldwin, Wis.

MILK

From Ten Cows Will Bring You as Much Money in St. Louis Co., Minn., as from Twenty Cows where You are Located. Why? Because:

1st. There are more consumers and less producers of milk; as result the price is nearly double.
2d. You will be one-half nearer to the market; have quicker delivery and less freight to pay.
3d. The cows having larger ranges to feed on, more grass, such as clover, bluejoint, red top, and peavine, are apt to give you more milk.

If you doubt this, please come and investigate, and we will show you at the same time about 10,000 acres of finest hay land, no swamp, on which you can open up a dairy or a stock farm that will be a money maker from the start.

PRICES FROM $7.50 TO $15.00 PER ACRE

TERMS VERY EASY. If you are interested write for our free Illustrated Folder and Railroad Rates, Etc., to **L. B. ARNOLD, 838 Pioneer Press Bldg., St. Paul, Minn.**
Assistant Land Commissioner Duluth & Iron Range R. R. Company.

Wisconsin

offers unexcelled opportunities for those who want to stop paying rent and make money in agriculture, in the fruit or dairy industry, or in sheep raising. Along the lines of the

Chicago, Milwaukee & St. Paul Railway

in Northern Wisconsin are many tracts of land admirably adapted to the home-seeker. In former timber tracts are many cultivated farms worth $50 to $75 an acre. Adjoining them, enjoying the same advantages, are unimproved farms for $7 to $20 per acre. Why not take a trip there and investigate these openings for yourself?

Additional information on request.

LANDS EASY TO GET

I have lands, all good farming land, in Wilkin and Polk counties, Minnesota and Grand Forks and Burleigh counties, North Dakota, that I will sell on crop payment plan, with small cash payment of from $2.50 to $3.50 an acre cash down. Must sell. A chance of a lifetime. Investigate. For description and how to reach them, address
E. E. SECOR, Buffalo Center, Iowa

Silage for the Dairy Cow.

ED. HOARD'S DAIRYMAN:—I want to give my testimony again in favor of the use of silage for the dairy cow. My last year's experience but added to the experience of the past, and even more satisfactory than ever before. I thought my mixed corn and cow pea silage of last year could not be beat; but I have just finished filling my round stave silos again, this being eleven times for one, and the tenth filling for the other, and this time the quality of silage is even better than ever before; planted in good land, securing fine stand of both corn and peas, and being blessed with an exceptionally favorable season, the crop was certainly fine.

The Albemarle corn grew very tall, some of it measuring fifteen feet in height, and bearing two to six ears of long slim corn per stalk—well filled, firm ears. Often the peas were found climbing to the top of the stalk, and bearing well filled pods of ripe and half ripe peas We had no wind or storms to lodge the crop; was standing straight with scarcely ever a fallen stalk, so that the McCormick harvester got it all but the roots, leaving the field clean as a field newly plowed. The cultivation was continued late with the 14-tooth, one-horse, Iron Age harrow, so that there are no weeds or grass on the ground, and to-morrow I expect to start the disk harrow with four good mules to it to sow the field in rye for winter pasture. I could not ask for the land to be in better condition for the rye seeding, and it can be so quickly done.

Last winter I fed my Jerseys from 1st of October until the 1st of April, full feeds of the corn and pea silage, and they had the run of the blue grass and rye pasture whenever the weather was not cold and stormy. I did not spend a dollar for the high-priced mill feeds, and I never had my cows to do better, or reach spring in better condition, and this new filling of silage is even richer than last year in grain of both corn and peas, owing to the very favorable season for the growth of the crop and the ideal condition of the weather when filling. The ground was dry so that I had no trouble with the corn harvester.

This is its third season's work in the field, and I did not see a single bundle of the fifteen feet-high corn that it missed tying. It is certainly a valuable implement for the dairyman. It would have been an utter impossibility for me to have saved this crop of corn and peas, as I did, by hand labor. There was absolutely no loss. An average yield of more than twelve tons per acre of the best feed reduces the cost of winter feeding to a point that I can make considerably more money dairying in winter than in summer, when we have the heat, the flies and the extra necessary care of the milk and butter that summer brings.

Labor was higher this fall than ever before with us, on account of the great demand for labor on some new railroads in our section, and the opening up of some more extensive phosphate mines near us—so that putting up my silage cost more this year than last year. The harvesting in the field, hauling to the cutter, cutting and packing in the silos, cost me exactly seventy cents per ton, allowing the same for my own teams, as for those I hired. I use a Tornado cutter and chain elevator, driven by a four-horse, over-head gear, lever horse-power. The cutter, I have used ten years; it tears up the butt ends of the largest stalks so that a calf can eat every particle. There is none wasted. I wore out one set of teeth on my cutter, and two years ago put in an entirely new set, at a cost of about $5, so it has proven a cheap machine for me, and seems yet almost as good as new.

My stave silos, built eight feet in the ground and the wooden tub setting on foundation of only two thicknesses of brick and the staves 14 feet long, making entire depth 22 feet, have never failed to furnish me good silage. One of them has been filled eleven years, the other ten, and they seem good for at least ten more. And the two with the plain board roof that covers them cost less than $100. I believe they have paid me their cost every year. One hundred per cent per annum does seem to be a good investment for a dairyman, if it is not for a speculator, and I do not see how any dairyman can can afford to keep cows without a silo.

It has many advantages besides its cheapness over any other way of feeding. The work of filling can be done at a season of the year when there is no other work pushing and the work is practically independent of the weather. No danger of loss from rain like saving hay, for if it rains the work can go on as soon as the raindrops cease; no use to wait for days of sunshine. Much less space is occupied to store a full winter's feed than any other way that feed can be stored. The danger of loss by fire is not one-tenth as great as dry hay or fodder stored in the barn. The silage is ready and convenient to feed at any time and in any kind of weather. All kinds of farm stock are fond of good silage.

I feed one or two feeds to my mules and horses; have never seen any ill effects and they are very fond of it. For the dairy cow it furnishes a rich, succulent ration the whole winter that will compare favorably with the best spring pasture in milk and butter production. And especially here in the south where we can grow our corn and pea silage as a second crop, after harvesting wheat, rye or clover, making it the cheapest winter cow feed in the world and for any one article of feed it is decidedly the best as a continued ration. My cows never tire on it from November until May.

J. N. MERONEY.

Darks Mill, Tenn.

We Don't All See Alike.

ED. HOARD'S DAIRYMAN:—It's true and no less fortunate than true, it seems to us, since reading in Sept. 18th issue of this paper, an article by H. C. R. whom we are compelled to classify as an pessimist of the bluest type.

We must admit there is much, too much, truth in some of the statements made in the article in question, which was headed, "He Thinks We Have a Difficult Task." He says: "Most of the farmers, dairy farmers as well, despise their business." If this be true, then we fear you have indeed a difficult and hopeless task; for when a man, for one moment, feels in any degree above his business he has placed himself beyond the pale of usefulness, as his conversion into an intelligent and liberal-minded citizen is out of question.

The writer, we fear, however, had not a clear conception of the true circumstances upon which he has based his argument. We would take issue at any rate with H. C. R. in the statement in question, and think that the following is perhaps nearer the correct view of the situation.

The wise man said: "The love of money is the root of all evil." We might add to this, "The love of popularity is the root of much discontent." It is this love of popularity that creates very much of dissatisfaction among farmers. To many it seems unpopular to feed swine, to follow a team all day, to milk half a dozen cows night and morning, etc. The observant, intelligent farmer, however, with his mind on his work, is so interested in even the simplest operations that its unpleasant features are entirely lost sight of.

It is justly unpopular, though, to slave, as too many do, from 4 a. m. till 8 p. m., or even sometimes later. Experience has proven repeatedly that the farmer who works on regular and reasonable hours makes quite as much net ultimately, other things being equal, as the former. Herein lies the cause of very much of the derision of which our noblest of callings is sometimes a subject. Again, the apparent awkwardness of manner and the often untidy appearance of the farmer, tend to excite, when in company with the more self-commanding and well-dressed, a spirit of self-disdain which breaks through the countenance, influences the general bearing, and so tends to intensify the situation. Another, and inexcusable, cause of the average farmer's low estimate of himself and his privileges, is his lack of power to converse freely and intelligently in company with those well-informed and up-to-date, due to a lack of knowledge. In these times of rural mail delivery and rural telephones, there is no reason why the farmer cannot meet and discuss intelligently the leading questions of the day with anyone.

These are only a few of many as simple causes of the discontent so prevalent among farmers and their families. Most of them know that there is nothing, absolutely nothing whatever, about their business which, studied and understood, should be despised; but a lack of knowledge of the real principles upon which they operate precedes a spirit of disinter-

Weight

Salt that makes weight makes money for the butter maker. DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*," made weight for one creamery at the rate of $8,000 a year in additional profit. The secret is simply this: Whatever weight you add in DIAMOND CRYSTAL SALT, *you obtain in increased weight of butter*. Its pure, dry flakes dissolve completely and become a part of the butter, instead of being washed out, or adhering to the worker rolls, like common, gritty, flinty salt. Our illustrated booklet "Just Salt" is just the thing for dairymen. Free on request.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY
TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

WINCHESTER REPEATING ARMS CO. NEW HAVEN, CONN.

estedness and discontent, and hence the farmer learns to despise himself rather than his business.

All the causes enumerated may easily be removed, and once removed, there is, at once an interest awakened, and as before stated the farmer goes out and in, regardless of what a few ill-bred people may say or think. "The Dignity of a Calling is its Utility." W. G. C.

World's Fair Exhibit of Brown Swiss Cattle.

The Brown Swiss Cattle Breeders' Association is making a strong effort to secure exceptionally good representation of that breed at the World's Fair, both in the breeding classes and in the cow demonstration. Harry McCullough of Fayette, Mo., who has been given charge of the assembling of the Brown Swiss cows for the demonstration has issued a letter calling attention to the importance of sending the best cows obtainable to St. Louis. He says:

"The World's Fair at St. Louis in 1904 will afford the best possible opportunity for calling the widest attention to the great excellence of the Brown Swiss cattle as profitable milk and beef producers, and the most should be made of this favorable occasion for advertising the breed. There are many superior Swiss cows in the United States that should take part in the World's Fair test, and the value of every good cow in the competition will be increased in proportion to her record.

"It is my desire to put some of the best Brown Swiss cows in the country in the World's Fair dairy test, and parties who have first-class cows that will freshen the first ten days of May or the last ten days of April, 1904, are requested to send me full information about the daily yield of milk this season, the weekly yield of butter, the beef conformation of the cow and any further information that will aid in forming an opinion as to the advisability of putting the cows in the World's Fair dairy test."

Silos at The World's Fair.

The silos on the live stock site are the first exhibit at the World's Fair to be ready. Representatives of the breeds to take part in the cow demonstration at St. Louis, have seen to their filling. They and the cutting machinery are supplied by an Ohio manufacturing concern without cost to the Exposition or breeds interested.

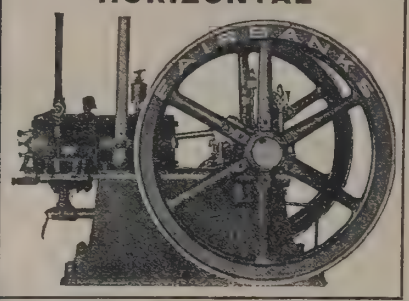
Growing Alfalfa in California.

ED. HOARD'S DAIRYMAN:—I will try and tell you in a brief way the way we grow alfalfa in California under irrigation. In the first place we level our land as near level as we can, and we use a civil engineer's instrument, and when we get done, it is very nearly as level as a floor. I put my land in checks with a levee around every quarter acre. In the winter we irrigate from the river, using the flood water to soak up our land; we put from 24 to 30 inches on; with what water we get from the rain, will make us two good crops Then in the summer we use a pumping plant to pump our water, and we put on about six inches for each crop, and by not pasturing the land any, but by cutting and feeding green, we can cut six crops a year, and have good pasture all the winter.

We sow our alfalfa here any time, but it is the best sown in the spring, say March; some sow with a nurse crop and some without. I sow 20 lbs. of alfalfa seed and 20 lbs. of barley. I sow the barley to shade the ground to keep it from baking, for just as soon as the alfalfa is large enough to stand it, we put about six inches of water on it, and if there was nothing to shade the ground, it would bake so hard the young alfalfa would not grow, for the softer and finer the ground the better.

We never let our alfalfa come to the bloom here before cutting, but always cut when it is in the bud—or I will tell you how you can always tell when it is ready to cut. Take the top of it and roll it in your fingers and if the water runs out of it you let it stand until when you mash it, it will be damp, but no water runs out, or take near the bottom and try it by chewing it and if it is tough and the fibre is stringy, I always get the mower in as soon as possible.

I will say this, if you want to see alfalfa grow to perfection, why just come to California — the dairyman's Paradise, where you don't have to keep your cows shut up in the barn all winter, but can let them run on green pasture and have all the good alfalfa hay they can eat. I also grow about three acres of carrots and they yield something wonderful, about 70 or 80 tons per acre. R.W. MITCHELL.
Monterey Co., Cal.



GOOD INTENTIONS ALONE CANNOT PRODUCE GOOD MACHINERY. Most all manufacturers are honest, but lack the experience and equipment necessary to turn out a thoroughly first class engine. We are the founders of the Gas Engine industry in the United States; have been building **OTTO** engines for 21 years, and operate the largest and most complete plant in the country devoted exclusively to the building of Gas and Gasoline Engines. Which will you buy, **Otto Experience** or **Others' Experiments**

Another Opinion on Farm Life.

ED. HOARD'S DAIRYMAN:—H. C. R.'s interpretation of the American farmer is too true to be denied. However, he is usually not the farmer who subscribes for HOARD'S DAIRYMAN. The per cent of your subscribers among dairymen ought to estimate the number of dairymen who do not belong to H. C. R.'s class, and all new subscribers should be recorded as decreasing this number. As soon as a farmer begins to interpret Nature's laws he begins to appreciate his occupation in such a way that an exchange, if possible, would not be made with the best lawyer or doctor living. It is the farmer who performs the old-fashioned routine without the assistance of the numerous scientific truths so freely distributed by the state experiment stations and the Agricultural Department at Washington, D. C., as well as the various farm papers, it is he and his family who are dissatisfied. However, there is a reaction in favor of the farm. Many who have left the farm for other occupations are returning, and a few who never knew anything of farming are seeking country homes.

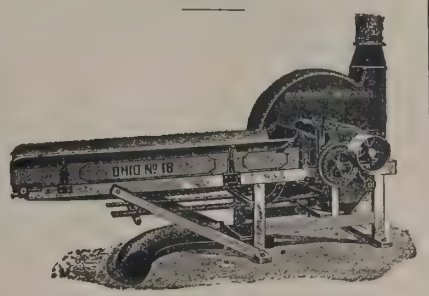
J. L. C.

Elmer, N. Y.

"A Wonderful Stimulant."

Your paper is a wonderful stimulant to the dairy business. We built a silo last year and we think it is one of the best investments we ever made. We built one of the round stave silos. There are no silos in this immediate neighborhood. We have a retail dairy and have been at the business four years.

I would like to know how to make a home-made carrier for my silo cutter. I have an Ohio No. 13 cutter, but the carrier I used last year was not atisfactory.



W. G. M.

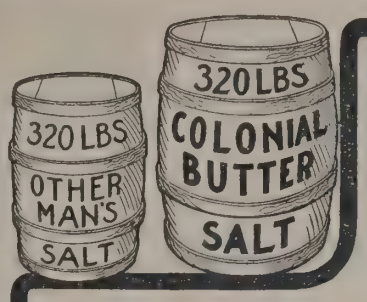
Montgomery Co., O.

If every reader of HOARD'S DAIRYMAN could be stimulated to some specific improvement every year, whether it be the erecting of a silo, fixing the stable for warmth and ventilation, discarding inferior cows, feeding good cows better rations, buying a first-class dairy bull, or any other of the matters which go to make up-to-date dairymen, what an increase would it not make in the aggregate profits received.

True economy consists not in withholding expenditures, but in making wise investments, whether of labor or money, and, although we have never tried to construct a "home-made carrier" we are constrained to believe that it is a matter of so much detail and exactness that one might better purchase from those skilled in that business than attempt to make one with his own hands and the tools found on a farm.

ILLUSTRATIO

MODEL ENSILAGE CUTTERS ON ST. LOUIS FAIR GROUNDS.



The enterprise and generosity of the Silver Manufacturing Company are playing a prominent part in the preparations for dairy proceedings at the Louisiana Purchase Exposition at St. Louis next year. It needs only mention of this concern's name to call up in the minds of our readers the "Ohio" Ensilage and Feed Cutters, regularly advertised in our columns. Two prominent dairy concerns, the A. J. C. Club and the Shorthorn breeders, determined to erect silos at St. Louis on the exposition grounds and to fill them with this year's corn crop against the time they shall want to use silage in the competitions there next fall. The Silver Mfg. Co. generously offered to donate, not only the ensilage cutting machinery, but also to erect the silos themselves. Both associations promptly accepted the offers and modern, up-to-date silos have been erected and filled with the approved ensilage machiery for which this company is so widely noted. It should be mentioned here that the Silver people erected the silo and furnished the ensilage machinery used by the Model Dairy at the Pan-American Exposition at Buffalo. Commenting upon the satisfactory character of the Buffalo plant, Prof. Edward Van Alstyne, superintendent of the Model Dairy, said: "I believe there are no machines of the same capacity that are as strong and at the same time will run as easily as the Ohio cutters. As to the No. 19 Monarch self feed cutter and blower elevator, which we used to fill the silo, I have nothing to say but words of praise. Our man in charge of the feeding tried his best to fill the cutter so that the blower might be clogged, but without the slightest apparent effect."

We do not have at hand data as to size of silo, manner and time of filling, etc. The work was done by the Ohio No. 18 cutter. We are reproducing here a small cut of this Ohio No. 18, with blower attachment, as exemplifying the type of cutter and blower made for ensilage purposes.

Cream SEPARATORS.

All about them and other things for the dairy and creamery.

A. H. REID, Philadelphia.

"Money Makers for Butter Makers"

Even though it were not apparent that

COLONIAL BUTTER SALT

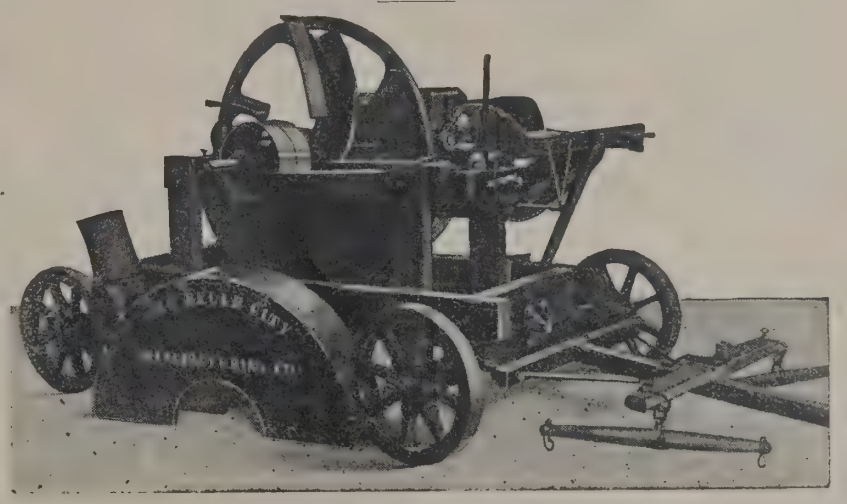
AND

LIBERTY BUTTER SALT

are superior to all other kinds in flavor, color and purity, there would always be apparent the fact that they are superior in lightness, bulk for bulk. Take the barrel that holds 320 lbs. of the other man's salt; it will hold but 225 lbs. of Colonial Butter Salt. The usual salt barrel has a 30 inch stave and a 19 or 20 inch head. The Colonial barrel has a 34 inch stave and a 21 inch head, to hold the same net weight of salt.

The lightness of the salt makes it dissolve quickly and evenly and prevents washing out in the working, and if there is any value in the "make weight" theory, this salt stands at the head in that respect.

THE FLAVOR IS PERFECT



THE COLOR PERFECT WHITE

The purity over 99 per cent, highest in the world. PROVE IT YOURSELF. To those who have never used Colonial Butter Salt (light, flaky grain) or Liberty Butter Salt (granulated) we shall be glad to deliver free of any charge a 56 lb. sack of either or both, on request. We only ask, in return, that you report to us your actual success with our salt.

Won't you try it today.

COLONIAL SALT CO., AKRON, OHIO.

ILLUSTRATION.

SILO FILLING

To those farmers who are fortunate enough to own a silo the question of filling it is as of much importance as is threshing and like threshing it is always advisable to hasten the work, while the corn is in proper condition and the weather favorable. In order that there may be no delays in this work it is very necessary to have a good ensilage cutter, one with large capacity, strong and light running, in short, one that can be relied upon at all times, and if the farmer is up to-date the cutter should be equipped with a blower.

The accompanying illustration shows the Belle City Cutter with chain feed and blower, which is up-to-date in every particular. The blast for elevating, as will be seen in cut, is furnished by heavy, steel wings attached directly to the knife wheel, which revolves in the upper and lower wheel casings. This constitutes the blower, making a very simple and at the same time a very effective and powerful means of delivering the cut feed.

There are no chains, belts or bearings required for this blower other than are required for the ordinary machine without this attachment and because of this the complete machine with blower can be run with about the same power required for operating the same size cutter with the old style carrier or elevator.

The manufacturers of these machines, THE BELLE CITY MFG. CO., RACINE JUNCTION, WIS., will be pleased to furnish full information regarding them upon request; they also have a treatise on ensilage which they mail free.

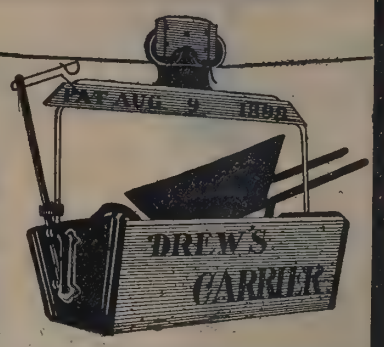
CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"



CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The

DREW ELEVATED CARRIER

will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating—it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.

It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

A Low Supply Can Separator

Keep Your Eye On The Can!
The higher you lift milk the harder you work. The higher the supply can of the separator the harder on the back—unless you want to risk your neck and your milk by stepping on a ladder or box. There is only one separator that has a low supply can.
Keep Your Eye On The Can!

THE SHARPLES DAIRY TUBULAR SEPARATOR

Has a supply can only waist high. You can empty a thirty quart can into it without stepping off the ground. The Tubular Separator has a simple tubular bowl, suspended from a single ball bearing. Won't vibrate—wabble—bind—or require rebalancing. Bowl contains only one tiny piece—which can be removed in an instant—permitting the bowl to be washed thoroughly in three minutes. All other separators have top heavy bucket bowls—set on a spindle—filled with troublesome, expensive discs or other contraptions. The Tubular has safe, enclosed gears running in a mist of oil. All other separators have bothersome oil cups needing constant watching. The Tubular has the only bottom feed—thus avoiding mixing whole and partly skimmed milk, and making the Tubular the easiest, fastest, cleanest, most durable skimmer known.
Catalogue No. 144 tells a truthful story about a separator that's different. It's free—write for it.

That Difficult Task.

ED. HOARD'S DAIRYMAN:—I have read and re-read the article of "H. C. R." in the DAIRYMAN, for Sept. 18 with the title, "He Thinks We have a Difficult Task" and your question, "What do our readers think of the article?"

I think he may be right in a small number of instances, but that most of the farmers and their families despise farming and get out as soon as possible, I am pretty certain will not apply to Vermont.

That they are interested in their occupation and have made good progress in it, is evident from the condition of their farms, buildings, etc., which any observing individual can take in at a glance.

You, Mr. Editor, have been in the state, taken at least as fair a view of the condition of agricultural affairs as can be gathered from passing through a country and in meeting with the men and women at the farmers' conventions. I am aware that these are the representative men and women of a state that are met at these gatherings, but they are not all of them by any means. Altogether, there is a large class engaged in this leading occupation of the state who are industrious, contented, prosperous and happy.

I think there are very few of the class in Vermont who despise farming and get away from it as soon as possible, from any such motives, to say the least.

A farmer or any of his family who will leave the occupation from such motives I think will, as a general thing, make poor progress in any other.

Of course, not all of the farmer's family do or can remain on the farm, or at least the ancestral one; but it is possible that if more would do so, it would be better for them. Still we do have the satisfaction of knowing that not a few of the sons of our own state have gone to other states and made their mark, an honorable one too, and when they come back to visit the home of their youth, it is with a true regard and respect for the old farm, the home and all that is connected with them. Despise them? No, not they.

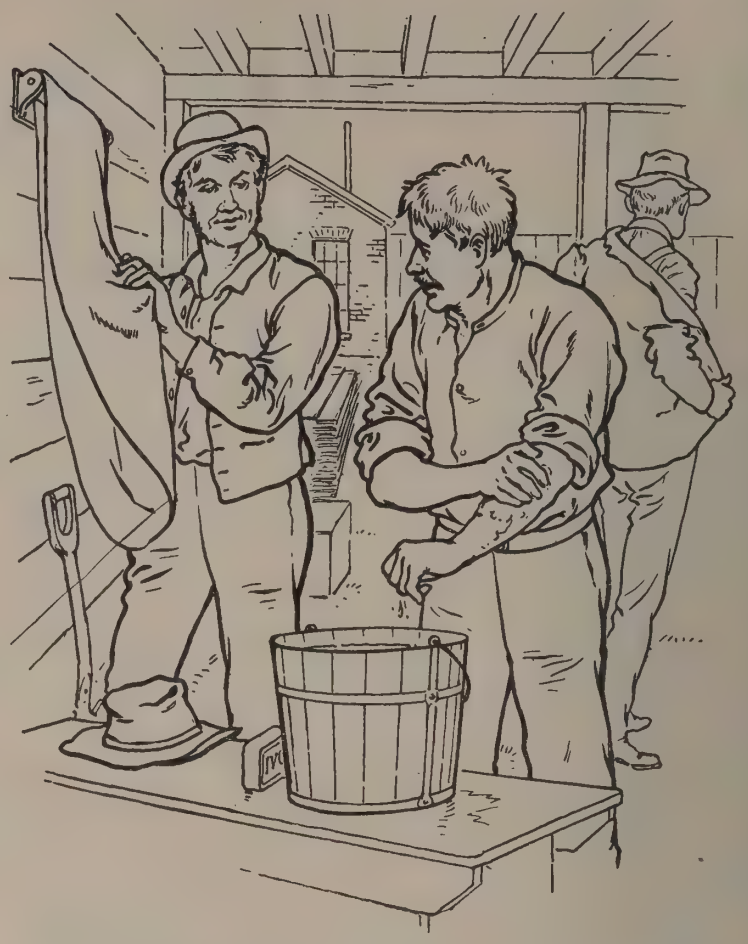
It is true that for various reasons a few of our farmers rent their farms—not sell them—and move into neighboring villages, but it was not because they despised the business, by any means.

There is quite a large class of business men, doctors, merchants, etc., who own farms, and although as a usual thing they do not live on them, they become greatly interested in the business and have faith enough to believe that the ownership of farm property is a safe investment.

There is a serious drawback at present from the great difficulty of obtaining help for the farm, both in the house and out of doors, and this does not appear to be confined to Vermont either. This is very discouraging to the owners of farms, and more of them will be rented as the result if there is not a change for the better.

This scarcity of help naturally leads to the employment of more labor-saving devices on the farm, as well as a change in methods, wherever this promises to be an advantage.

The work of the DAIRYMAN is among the more progressive class of farmers, those who have a taste for reading and can thus be reached.



If we can only get men to read without prejudice, study what they read, compare notes and experience with others, there is hope of doing them much good; but there is a class that it is difficult to reach, and it requires all of the energy and skill of an agricultural journal and the aid of its most interested friends and helpers to get the attention of this class—the one so desirable to reach—but this is being done and the good seed of agricultural progress so long and carefully sown is surely bringing in its returns.

So there is encouragement to work on and to extend farther and farther the help that is so surely needed, believing that in due time there will be reaping for the sowing.

As the Senior Editor of the DAIRYMAN is pretty well acquainted with Vermont, including my own—Franklin—county, I wish to add here to my article the following editorial paragraph taken from the *St. Albans Messenger*, a leading state paper, as relating to the present position and prospects of this county:

"Franklin county may well be proud that there are no so-called "abandoned farms" within its borders. The thrift and prosperity of this county, the pro-

Improving the Cheese Milk.

Improvement in Cheese Must be Started by Getting Better Milk.

J. Lehnerr, read the following paper before the Minnesota Cheesemakers' Educational Convention:

We can make just as good cheese in the state of Minnesota, as they do in any other state of the Union. All we need is the production of a good, clean-flavored, unadulterated milk.

How can we improve the quality of our cheese?

There are people living today who believe that our cheese factories are O. K., that is, good enough, and that there is no need of getting alarmed. Yes, there are people who believe in leaving well enough alone; who never want to go to any extra trouble and expense in order to try to improve their methods and old ways of doing things. They say this talk of keeping up with the times, is a new-fangled notion, and time costs money for those who try it: in fact, we are often told that those who stick to the "good, old fashioned ways" and do not have much to do with these up-to-date things, are the most successful and make the most money.

I, for one, look at it in another light and think if we want to make any progress and want to improve the quality of our cheese, we must not feel satisfied with our present standard or degree of perfection, and think we are all right. The moment we do this, we are at a standstill, and that means that we are going backwards; and those who are progressive and up-to-date will improve and advance, and we will be pushed aside to see the great procession of the onward moving, up-to-date passers-by.

Another thing we probably should do more, but can not very well, and that is to reject all milk which has not been thoroughly cooled or aerated, or contains any dirt or smell whatever. But if this were done, the cheesemaker would be apt to have a pretty lively time and considerable trouble. Personally, I have tried to follow this rule to some extent, but found it impossible, as our patrons do not practice aerating their milk and can not detect anything wrong with the milk, even if is slightly tainted; therefore, would think a wrong had been done. So we are simply obliged to accept the milk which we do not care to, and lots of it, too, just to keep peace and prevent trouble.

But now to come to the point: No body, I don't care who it is, can make a very high grade of cheese out of tainted or imperfect milk. Every patron that allows his cows to remain dirty, covered with a thick coating of manure, never takes a brush to clean the cows, and there are plenty of them, is surely not in favor of improving the quality of cheese. They claim they do clean milking even though the cows be dirty. I do not take much stock in this theory. Milk, cheese and butter are articles of food to be eaten by men, women and children; a great many forget this. They seem to think it does not make any difference what kind of milk is sent to the factory, judging from what may be seen on the strainers of factories, and I believe if the dirt which falls into a milk pail could be separated, placed on a plate for food for such a milker, he would change his mind, and I do not doubt but it would be a very good medicine for the man. If the cow is clean and your hands and pails are also clean. there is every reason to believe the milk will also be clean. On the other hand, if the can is dirty and the milker is filthy, the milk is bound to be tainted. In the summer, the cows wander over dirty sloughs and the udders become dirty. The udder should be washed at every milking and unless this be done, bad milk comes to the factory. Many claim that it does not pay to brush the cows. wash udders, feed balanced rations, aerate and cool milk. Men who make this claim are invariably the ones who never try it and their opinions are worthless. Can anybody tell me how much they have lost by taking good care of their cows and doing the other things mentioned? I say, take your hat off when you meet a good cow.

When you cultivate, prepare and care for a field properly, you will get larger crops and better results than by little or no care and cultivation. This is an established fact that none can dispute. The same principle holds true in the dairy department of the farm as well as in the crop department. If there is not money enough in our cheese business to warrant our doing the right work, I say quit the business. Do not bother with it unless you can do it as it should be done. Remember the old saying. Whatever you do, do well.

A little more about taking care of the milk. I will say: After the milk is drawn from the cow, milk should be properly aerated and cooled. Filth on the cow's udder carries a great many bacteria into the milk. Germs in milk multiply very rapidly unless the milk is aerated and cooled immediately after it is drawn from the cow. This should be done outside of the stable. Cooling milk arrests the growth of germs. The sanitary condition of milk is very important. The purity of the water supply and the condition of the stables are the two most important factors for the production of good milk. A cow's stable is a place for a cow to live in, not to exist in. The health of men and women depends, to a large extent, upon the cow; the health of the cow depends largely on her house being properly aired and cleaned; therefore health of children and men depends in a great measure on how the cow's stable is looked after.

Neither cattle nor other animals should be allowed or compelled to drink stagnant water. In fact no animal should be given water to drink which we would hesitate about drinking ourselves.

Some causes of bad flavored milks are foods, such as Swede turnips and tops, rape, musty meal, raw potatoes, grass having bad smelling weeds, such as leeks or rag-weed.

If you have some old and rusty cans which leak badly and have dinged covers and spill one-half a gallon or more of milk every day they are sent to the factory, should you continue to use them? Will it pay to buy new ones?

To wash milk pails, milk cans, etc., they should first be rinsed in lukewarm water, next washed with hot water and then scalded, after which put them in a nice place to air and dry. Do not wipe dairy tinware with a dishcloth. Make a bonfire of all the old dishcloths that are used for wiping dairy utensils, and the flavor of the milk will go up 10 per cent.

Now we come to the weigh room. There is the good chance to make the

A Contrast in Farm Buildings.

good or the poor cheese. It is the duty of the cheesemaker to inspect carefully the milk and milk cans and can covers, take out samples of both morning and evening milk, make your test every two weeks and invite farmers to be present, if possible, when you make the test. It is the duty of the cheesemaker to examine daily the inside and outside of the opening from the weighing can into the milk conductor. He should be thoroughly qualified as to teaching the farmers improved methods of handling stock, feeding stock, general farming and to answer questions asked by farmers about the weigh room.

Acid Test of Cream.

[Extracts from *Illinois Station Bulletin No. 32.*

The sourness of cream is one of the things considered by many dairymen in making butter. They may be not agreed on the amount of acidity that the cream should have when it is ready for churning, but many base their judgment on the taste or appearance of the cream.

The strength of the alkaline liquid and the amount of cream taken for each test are constant, known quantities, always the same in comparative trials of different lots of cream. The amount of acid in the measured quantity of cream is unknown until, by testing it, it is observed how much of the standard alkaline liquid is necessary to use to produce the pink color.

In the fall of 1899, this method of testing the acidity of cream was used by Dr. Manns at the creamery of Gurler Bros., DeKalb, Ill., and also in churnings of cream which he made at this station. He found that when cream was churned at a temperature of 58 to 62 degrees, F., too much acid in the cream injured the quality of the butter, and too sweet cream churned at this temperature caused a loss of butter in the buttermilk. The butter was not all churned out unless the cream was sufficiently soured. The butter was of poor quality if the cream was too sour.

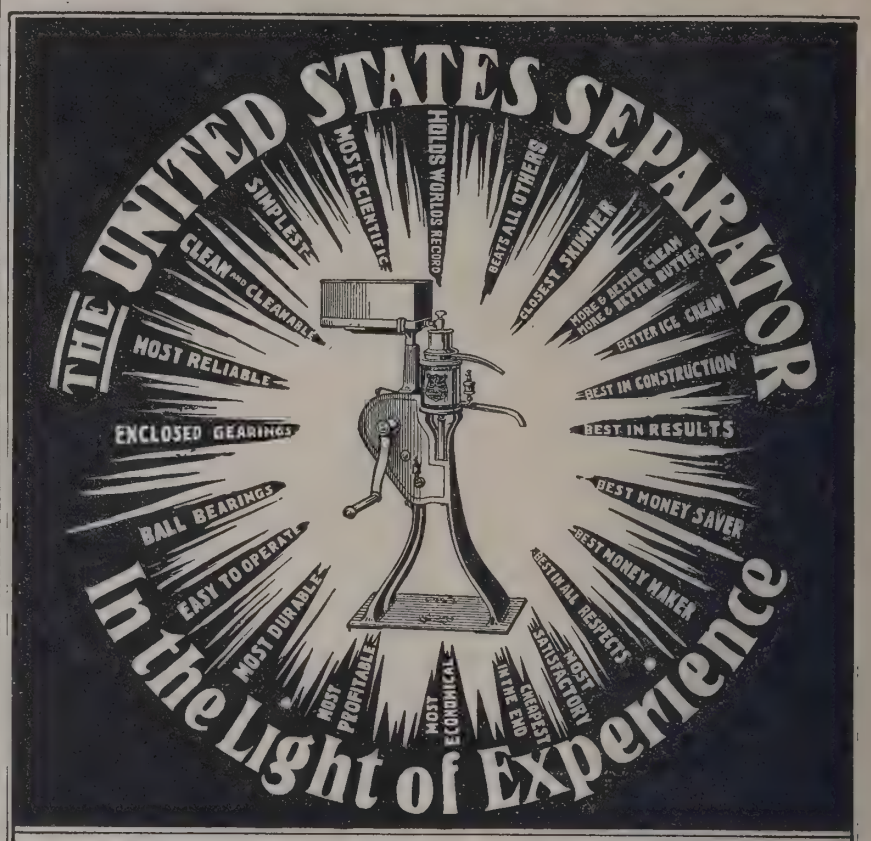
PROF. A. R. PEARSON.
Appointed as Professor of Dairy Industry at Cornell University.

CREAM TESTING WITH ALKALINE TABLETS.

A formula has been worked out by which a definite amount of solid alkali can be made into a tablet, containing both the alkali and the color indicator necessary for testing the acidity of cream or milk.

Each tablet contains a definite amount of alkali which will neutralize as much acid as 4.66 cubic centimeters of a one-tenth normal alkaline liquid. A test of the number of tablets showed them to be very uniform in the amount of alkali contained in each tablet. The extreme difference amounted to three-tenths of one cubic centimeter of the one-tenth normal liquid. One thousand tablets weigh about 12 ounces. Each tablet is about 3/8 of an inch in diameter and 1/8 of an inch thick, and they can be used instead of the one-tenth normal alkaline liquid and the liquid indicator already mentioned. The tablets can be used for testing the acidity of cream in the following way:

DISSOLVING THE TABLET.



A 50 cubic centimeter glass cylinder graduated, and on a foot, is found to be a convenient piece of apparatus to use in preparing the solution of tablets. It is made of stout glass not easily broken and can be obtained of any dealer in chemical apparatus. Put five tablets into this cylinder, add hot or cold water until the cylinder is filled up to the 50 mark, then cork the cylinder and shake frequently until the tablets all disappear in solution. If the solution of the tablets is hastened by shaking the bottle or stirring the liquid, it should be done in such a way as to prevent any loss. As they do not dissolve immediately, they should be put to soak about one-half hour before the cream is to be tested. The strength of the solution does not change perceptibly by standing four or five hours, but there is some change in a tablet solution which is a day or more old. The solid tablet will not change and the only precaution necessary is to use a fresh solution of the tablets in testing the acidity of the cream. Excepting the flocculent residue or settlings, which will not dissolve in water, the tablets should all disappear in the solution before it is added to the cream to be tested. When the solution is complete, the cylinder contains a reddish colored liquid, the alkaline strength of which is indicated by the number of tablets which were put in the cylinder.

TESTING THE CREAM.

The cream to be tested should be thoroughly mixed. Then measure 25 cubic centimeters of the cream into a glass tumbler or cup. If the cream is very thick 25 cubic centimeters of clean rain water may be mixed with it in the dish. The sourness of the cream is then ascertained by adding the reddish colored solution of the tablets to this measured quantity of cream until it retains a pinkish color. When the two liquids, cream and tablet solution are thoroughly mixed, the pink color does not remain permanent until the acid of the cream is completely neutralized by the alkali of the tablets. An excess of the alkali causes the color to increase. The acidity of the cream is measured by adding just enough of the alkali to produce a permanent change of color from white to pink. No further addition of the alkali is necessary as the first change of color indicates the point when the acid is all neutralized. A piece of white paper placed under the tumbler in which the cream is tested will help to show the change of color.

The amount of alkali required to produce this change of color shows the sourness of the cream as indicated by this test. A change of color may be produced in 25 cubic centimeters of sweet cream by a solution of one or two tablets. As the sourness of the cream increases, 25 cubic centimeters of it may require a solution of three, four or five tablets to change the color.

The indications are that a cream which requires a solution of six or more tablets to change its color is too sour.

BELLOWS FALLS, VT.

Did You Ever Keep a Record Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want." We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at following prices:

Price 5c Each	6 for 20c	12 for 30c	25 for 50c

SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES

HOARD'S DAIRYMAN.
FORT ATKINSON, WIS.

The butter made from such cream will be off flavor. The only general direction that can now be given as applicable to nearly all cream, is to churn it when 25 cubic centimeters of the thoroughly mixed cream is not colored by a solution of four tablets, but is decidedly colored by a solution of five tablets.

Some dairymen may prefer to churn a less acid cream and adopt the sourness of cream which will give a color with a solution of three tablets.

Comparative trials made by each person of the acidity of the cream and the flavor of the butter made from it, will be a satisfactory guide to follow.

The test will show the sourness of each lot of cream, so that a uniformity of acidity can be had in each churning.

How much acidity each lot of cream should have, or whether cream should be churned sweet or sour, may be a matter of opinion with the butter maker. This test serves as an aid to show him when the cream is of the sweetness or sourness which he prefers. It will also show when the cream ought to be churned in order to prevent it from spoiling the butter, by ripening too far and becoming too sour for the best results.

The complete outfit, including, 1000 tablets of 25 cubic centimeters, pipette and one 50 cubic centimeter cylinder, costs $3, delivered. One thousand tablets ought to make 250 tests.

Milk Fever of the Cow.

Press Bulletin.

Milk Fever, technically called parturient paresis or parturient apoplexy, is characterized by the following symptoms:

The newly calved, adult cow, that has had an easy labor and "cleaned" promptly, suddenly becomes restless, sticks her tongue out, refuses feed, steps up and down with her hind feet, gets a "kink" in her neck, "wabbles" when exercised, and finally goes down paralyzed, with milk, urine and manure suppressed, tucks her head into her side, snores loudly, becomes bloated, unconscious, and lies stretched out upon her side until death occurs in from three hours to three days. Some cows show delirium, struggle and pound the head upon the ground. The majority of cases, however, are quiet, and have no fever; the temperature is more often below normal.

CAUSE.
